GQA ASSESSMENT 1995

NORTHUMBRIA AND YORKSHIRE REGION

To allow the development of a National method of evaluating water quality, the rivers in all the NRA regions of England and Wales have been divided into reaches, which are numbered using a coding system based on the hydrological reference for each river basin. Each classified reach then has a chemistry sample point and a nearby biology sample point assigned to it. The chemistry sample point is monitored for Biochemical Oxygen Demand (BOD), Dissolved Oxygen (DO) and Total Ammonia. Samples of macro invertebrates (bottom living animals) are taken at the biology sample point.

Chemistry grades are reported every year. Three years data (e.g. 1993, 1994 and 1995 data) are combined to calculate the grade for a stretch. It is anticipated that biology grades will only be reported once every five years and that one year's data will be used to assign the grade for a stretch. This report therefore lists results for a national biological monitoring survey carried out in 1995 and the next survey from which results will be reported will take place in the year 2000.

Each regions results are sent to a National Centre where the GQA grades for chemistry and biology are calculated. A National report is produced and each region can then produce more detailed reports on the quality of their own rivers. For Northumbria and Yorkshire Region, the regional report has been divided into two parts:

PART 1: REACH CLASSIFICATION

This report contains a listing of the river reaches within the region, with their start and finish grid reference, approximate length, and the 1990 and 1995 GQA biology and chemistry classification. The reference codes (SPTs) for the biology and chemistry sample points used to classify the reach are also included.

For some stretches of river the sample points used to define the biological or chemical quality of that stretch have been altered during the past three years. For stretches where this is the case the change is denoted by a star (*) on the GQA results sheets either next to the CHEM 95 SPT CODE details (for changes in a given chemical sample point) or next to the BIO 95 SPT CODE details (for changes in a given biology sample point).

PART 2: SAMPLE POINT REPORT

This report contains more detailed information on the summary statistics for each chemical GQA sample point. The sample points are listed in numeric order and the summary statistics from the 1990 and 1995 classification are provided for comparison.

Chemical sample points classifying reaches where there has been no change over the years 1993 to 1995 are listed in numeric order in the main part of the report. Appendix A lists the summary statistics for reaches where there has been a change in the sample point over the last three years. The statistics in this case are on a reach basis and the sample point listed is the one used in 1995.

The combination of chemical and biological quality gives a more complete picture of the overall health of the river than either alone. Invertebrates are sensitive to a range of toxic and organic pollutants, while chemistry GQA is based on the effects of organic pollutants only. A difference between C and B classes can mean that the river is affected by substances such as metals and insecticides which are not included in the chemistry GQA.

THE CHEMISTRY COMPONENT OF THE GQA SCHEME

The basic chemical grade of the GQA Scheme is defined by standards for the concentration of BOD, ammonia and dissolved oxygen. These have been selected because they are indicators of the extent to which waters are affected by wastewater discharges and rural land use run-off containing organic, degradable material. The quality of many of our rivers and canals is affected by such discharges which include effluents from sewage treatment works and industries, and drainage from farms. These three simple determinants are therefore the best overall basic chemical measure of river quality for the purpose of GQA which will apply to all rivers and canals within the classified network.

The use of these three determinants provides some continuity with the NWC system. In the GQA assessment, however, data from three years sampling is used to make the assessment of class. For the 1995 assessment, data from 1993, 1994 and 1995 has been used. The boundaries of each class are given in the table below.

GQA CHEMICAL GRADING FOR		RIVERS AND	CANALS	
WATER QUALITY	GRADE	DISSOLVED OXYGEN (% SATURATION 10 PERCENTILE)	BIOCHEMICAL OXYGEN DEMAND (BOD) (mg/l) 90 PERCENTILE	AMMONIA (mg/l) 90 PERCENTILE
VERY GOOD	A	80	2.5	0.25
GOOD	B	70	4	0.6
FAIRLY GOOD	C	60	6	1.3
FAIR	D	50	8	2.5
POOR	E	20	15	9
BAD	F	LESS THAN 20	MORE THAN 15	MORE THAN 15
The overall grade assigned to a river or canal reach is determined by the worst of the three grades for the individual determinants				

Adapted from:- *The Quality of Rivers and Canals in Wales (1990 to 1992)* Report of the National Rivers Authority May 1994, Water Quality Series No. 19

THE BIOLOGICAL COMPONENT OF THE GQA SCHEME

This year's GQA document includes grades for the biological quality of the Region's rivers.

The GQA biology scheme is based on macro invertebrate communities (bottom living animals). Five classes exist. A Grade 'a' denotes excellent biological quality and a Grade 'f' bad biological quality. Further details of grades are given below:

Grade a - VERY GOOD

The biology is similar to (or better than) that expected for an average and unpolluted river of this size, type and location. There is a high diversity of Families, usually with several species in each. It is rare to find a dominance of any one Family.

Grade b - GOOD

The biology shows minor differences from Grade 'a' and falls a little short of that expected for an unpolluted river of this size, type and location. There may be a small reduction in the number of Families that are sensitive to pollution, and a moderate increase in the number of individual creatures in the Families that tolerate pollution (like worms and midges). This may indicate the first signs of organic pollution.

Grade c - FAIRLY GOOD

The biology is worse than that expected for an unpolluted river of this size, type and location. Many of the sensitive Families are absent or the number of individual creatures is reduced, and in many cases there is a marked rise in the numbers of individual creatures in the Families that tolerate pollution.

Grade d - FAIR

The biology shows big differences from that expected for an unpolluted river of this size, type and location. Sensitive Families are scarce and contain only small numbers of individual creatures. There may be a range of those Families that tolerate pollution and some of these may have high numbers of individual animals.

Grade e - POOR

The biology is restricted to animals that tolerate pollution with some Families dominant in terms of the numbers of individual creatures. Sensitive Families will be rare or absent.

Grade f - BAD

The biology is limited to a small number of very tolerant families, often only worms, midge larvae, leeches and the water hoglouse. These may be present in very high numbers. Even these may be missing if the pollution is toxic. In the very worst case there may be no life present in the river.

GLOSSARY

REACH INDEX	UNIQUE REFERENCE FOR EACH RIVER REACH
RIVER NAME	MOST COMMONLY USED NAME FOR EACH RIVER
REACH FROM / TO	START/END POINT OF A REACH
