REGIONAL WATER QUALITY MONITORING AND SURVEILLANCE PROGRAMME, 1992

QUALITY ASSESSMENT OF ENCLOSED WATERS

TECHNICAL REPORT NO. FWS/92/005

SUMMARY

The Controlled Waters (Lakes and Ponds) Order, 1989, for purposes of the Water Act 1989, defines certain reservoirs as relevant lakes and ponds. This monitoring programme enables the quality of such reservoirs and other enclosed waters to be assessed.

28 reservoirs are monitored monthly to assess water quality in standing waters. Samples are analysed from three depths (surface, 0-5 m composite, bottom + 1 m). A total of 200 sites are visited each month and these are divided into 84 river sites (inflow or outflow streams) and 116 sites located in reservoirs and sampled from a small boat. This programme produces 2400 samples for analysis.

At each site 52 standard sanitary, metals and bacteriological determinands are analysed monthly, and 31 pesticide determinands are analysed quarterly and an assessment of the phytoplankton is made each month. Temperature and dissolved oxygen profiles of the water column are obtained each month by measuring values at 1 m intervals. The major feeder (inflow) and outflow streams are also monitored chemically.

The identification of monitoring points began in September 1991, although it was not until January 1992 that all reservoirs were visited following an increase in sampling resources. Sample locations have now been identified for all reservoirs and feeder streams.

All monitoring points have been plotted onto maps contained in Technical Report No. FWP/92/001, Water Quality Monitoring Locations, 1992.

PROGRAMME SUMMARY

No. of Sampling Locations	No. of Samples	No. of Determinands

INTRODUCTION

The Surface Waters (Classification) Programme monitors the quality of the region's standing waters. Most of the standing waters are reservoirs and there are only two natural standing waters of any size (Slapton Ley and Loe Pool) in the region.

Not all the reservoirs in the region are monitored. Owing to limited resources, a priority list of the most important sites was drawn up; public water supply (PWS) reservoirs are included, but some of the standby or decommissioned reservoirs are not sampled (see Table 1).

TABLE 1

Reservoirs sampled by Enclosed Waters Programme	Reservoirs NOT sampled by Enclosed Waters Programme
Otterhead	Jennetts
Squabmoor	Darracott
Kennick	Cargenwen
Trenchford	Challacombe

Melbury	
Siblyback	

The first samples were collected in September 1991 and it was envisaged that reservoirs would be sampled on a rolling five year programme. However more resources became available and this has enabled the programme to be modified to allow each reservoir to be visited monthly. The revised programme commenced in April 1992.

Samples are collected from three depths on each reservoir in order to monitor water quality within the water column. This is particularly important in the summer when thermoclines develop and there may be a significant difference between surface water quality (from the epilimnion) and bottom water quality (from the hypolimnion). Feeder streams and outflows are also monitored so that the effect of impoundments on the river system can be assessed. In addition, when combined with hydrometric data, the loading of critical elements (eg phosphorus) flowing into a reservoir can be calculated. This information is very useful when planning possible management strategies to control algal blooms.

Sampling buoys are currently being deployed in reservoirs in order to establish fixed sampling stations. New User Reference Numbers (URNs) have been created to accommodate new sample sites.

DESCRIPTION OF PROGRAMME

The principal reason for the programme is to classify inland waters as prescribed by Statutory Instrument 1989 No. 1148. The feeder streams have been added to the programme in order to establish whence, and in what quantities, nutrients and pollutants are entering the standing waters.

Surveys in 1989 and 1990 revealed that many standing waters in the region suffered from blooms of blue-green algae. The algal information from this programme allows algal blooms to be monitored.

Where a Sewage Treatment Works is situated upstream of a waterbody and is supplying a nutrient load which is accelerating eutrophication, the information from this programme will help to support the case for designating the waterbody a sensitive site under the Urban Waste Water Directive.

The information from this programme will provide a scientific basis on which to base reservoir management strategies in waterbodies where the NRA is responsible for ensuring that water quality is suitable for treatment and subsequent public water supply.

The programme provides, in some cases, new information on waterbodies which have not previously been investigated.

PROGRAMME INFORMATION

Numbers of:		
Sampling points	Samples	Determinands
200	2400/ year	149,600 /year

EXPLANATION OF SCHEDULE CONTENTS

The sampling schedule is presented in Table 2. The water bodies are grouped into those sampled by the East Area (Avon to Wistlandpound), followed by those sampled by West Area staff (Argal to Upper Tamar Lake). 'SRRM' in the second column of the programme refers to the Route Code on the MENSAR computer system, and allows samples from the relevant group of sites (third column) to be pre-registered by the laboratory system. NGR is the six figure national grid reference for the sampling site. For the sampling sites on the reservoir, three of the NGRs are identical as the location of the sampling point is the same on the map, the difference between the sites is the depth at which the sample is collected. A URN (User Reference Number) is a unique reference for a particular sampling point. Not all the URNs have been set up yet by South West Water and the gaps in this column are filled in as the new URNs are confirmed. ARG (Analysis Required Group) is the suite of determinands which will be analysed by the laboratory. ARGs S355 and S371 are suites for insecticides and herbicides respectively; each is analysed quarterly. ARGs S319 and S477 contain standard sanitary and metals determinands and are analysed monthly. In addition, S319 contains bacteriological determinands whereas S477 does not; this is because bacteriological analysis of waterbodies sampled in the west area is carried out by the South West Water Services Ltd laboratory in Truro, as samples could not always be ready for analysis within the six hour limit (from the time of collection) if they were sent by courier to the laboratory at Manley House.

ENDORSEMENT

The contents of this programme have been agreed by the Water Quality Planner, Field Controller and Laboratory Controller.

1993 PROGRAMME

The 1992 programme will be reviewed at the end of the calender year and recommendations will be made about the frequency of sample collection and determinand suites. If sufficient resources are available, the programme will be increased to include the reservoirs not currently monitored in the 1992 programme (see Table 1).
