REGIONAL WATER QUALITY MONITORING AND SURVEILLANCE PROGRAMME FOR 1992

IMPACT ASSESSMENT OF EFFLUENT DISCHARGES ON RECEIVING WATERS

TECHNICAL REPORT NUMBER FWS/92/010

**SUMMARY**

The 1992 Impact Assessment of Effluent Discharges on Receiving Waters Programme evolved from a review of the existing 1991 programme, whose primary purpose was to provide data for the review of discharge consents, as result of the newly implemented Water Resources Act Consent register and the Charging for Discharges Scheme. This programme is integrated with the effluent discharge compliance assessment programme, Samples are taken not only of a significant discharge but also of the receiving water immediately upstream of the discharge and at the edge of the mixing zone downstream of the discharge.

The 1992 programme has several purposes, such as:

- identifying any impact by the discharge on the receiving waters.
- characterising upstream water quality.
- providing a database against which change can be measured.
- filling the monitoring network gaps, by including small but critical streams.
- providing data to support the EC Urban Waste Water and Nitrate Directives.
- early detection of receiving water problems.
- protection of 'fitness for use' via the NWC Classification system.
- supportive information for an effluent discharge consent review.

The programme will be reviewed in the Autumn 1992. Unimpacted sites may form part of a rolling programme. Site duplication, if any, with the routine monitoring of river water quality, will be eliminated. The tidal and freshwater components may be separated.

The Schedule indicates; site location, site reference, frequency of monitoring and analytical determinand group used. The Programme includes receiving waters in the vicinity of: South West Water plc discharges, trade and other discharges and fish farm discharges.

**PROGRAMME SUMMARY**

Numbers of sampling points	Numbers of Samples	Numbers of Determinands
1177	13,586	213,626

## 1. INTRODUCTION TO 1992 IMPACT ASSESSMENT OF EFFLUENT DISCHARGES ON RECEIVING WATERS PROGRAMME

The 1992 Impact Assessment of Effluent Discharges on Receiving Waters Programme for fresh and tidal waters evolved from a review undertaken in Spring 1991 of the existing programme whose primary purpose was to provide data for the reviewing of discharge consents, as part of the development of the Water Resources Act consent register and the introduction of the Charging for Discharges Scheme.

The programme required that, concurrently with sampling the discharge, the river was sampled upstream and downstream of the discharge point (at the edge of the mixing zone). This programme incorporated both Tidal and Freshwater discharges, though the tidal waters monitoring represents no extra sampling effort, as it is incorporated into the EC Dangerous Substances monitoring programme. However, some additional sanitary determinands were added to the dangerous substances determinand suite.

The programme was reviewed and modified to meet new objectives, newly consented significant discharges were added and those discharges for which consents had been revoked during the year were removed from the programme. The programme continued to cover both tidal and freshwater discharges.

The determinand suite used for monitoring was extended to meet the requirements of the new objectives.

## 2. DESCRIPTION OF PROGRAMME

The 1992 Programme serves more than just the original purpose of providing the necessary data for consent reviews and the Charging for Discharges Scheme.

These additional objectives are:

- (a) to identify any impact by the discharge on receiving waters.
- (b) characterise the upstream water quality of watercourses not sampled for at least 12 years.
- (c) to enable the impacts of the discharges to be differentiated from the background water quality. Hence the need for an upstream 'unimpacted' location.
- (d) to provide a database against which 'absolute' change over time can be measured using the National Water Council (NWC) Classification System and Estuary Classification Scheme.
- (e) to assess the impact of the discharges on the fitness for use, by means of the NWC Classification System.
- (f) provide supportive information for an effluent discharge consent review.

- (g) to provide data in support of the EC Urban Waste Water Directive.
- (h) to provide data support of the EC Nitrate Directive.
- (i) to provide data that allows, via the Exceptional Data Reporting System, a mechanism for early detection of deterioration of receiving water quality.

There is a minimum group of determinands required to meet the objectives outlined above, these are described in Appendix A.

The provision of adequate water quality data for small streams is vital, as these are the 'lungs and arteries' of the main river systems. Data collected from these sites can be used for rapid isolation of pollution sources in the event of a problem. The data can also be used to assess the potential impact of proposed discharges, previously this required special ad-hoc sampling. These small streams are frequently fish spawning and nursery areas and therefore deserve the same degree of protection as the larger rivers.

These watercourses are also subject to abstractions for licensed and legal but unlicensed uses by riparian properties, these are numerous between 20-30,000 throughout the region.

Assessment of 'fitness for use' is provided via the NWC River Water Quality Classification System, which provides protection on a 'use' related basis by the inclusion of the following:

- a) EIFAC (European Inland Fisheries Advisory Commission) standards, for the protection of fisheries.
- b) EC Surface Water Abstraction Directive standards in order to protect surface water intended for potable water supplies.

## 2.1 SITES MONITORED

This programme monitors the impact of 488 (428 into freshwaters, 60 into tidal) Water Company sewage treatment and water treatment works discharges at 910 (850 freshwaters, 60 tidal) locations, mostly at monthly intervals. New discharges introduced to the programme for the first time are monitored 20 times per annum.

The impacts of 60 (53 into freshwaters, 7 into tidal) significant non-water company discharges at 113 locations (106 freshwater, 7 tidal) are measured at frequencies of between 4 to 12 times per annum. Because of seasonal activity seven locations are monitored only during the Summer months.

The impacts of 77 Fish Farm Discharges at 154 locations are measured at a frequency of 18 times per annum (12 times of one analytical suite and three of another). The principal objective of this programme is that the NRA inherited a situation where most fish farms were either unconsented or the

existing consents were in need of a review on an environmental needs basis. The consenting and re-consenting of these discharges is proceeding to timetable agreed with the Water Abstraction Licensing staff, who are licensing most of the fish farm abstractions.

## 2.2 1993 PROGRAMME

As part of the planning for the 1993 programme, it is intended to:

- (a) review the programme in the Autumn 1992. Options include the introduction of a rolling programme, for unimpacted sites and those sites without known water quality problems.
- (b) to improve efficiency the Tidal and Freshwater sites by separation into discrete programmes.
- (c) to remove any duplication of monitoring sites between this and other monitoring programmes. To this end a review will be undertaken to ensure this objective is met.
- (d) to examine the requirement for additions to the determinand suite.
- (e) to review monitoring frequencies at all sites.

### 3. PROGRAMME INFORMATION

Numbers of		
Sampling points	Samples	Determinations
1023*	12074	194,726
154**	1512	18,900

\* water company, trade and other discharges

\*\* fish farm discharges

### 4. SCHEDULE EXPLANATION

The attached schedule describes both the Discharge Audit Programme and the Discharge Impact Assessment Programme. It is intended that this programme will be split into two for 1993.

The first column indicates the name of the discharge being monitored.

The second column describes the name of the receiving waters and site description.

The third column indicates the receiving waters site reference number, known as the U.R.N. (user reference number) and the U.R.N for the discharge.

Column four shows the Ordnance Survey national grid reference( NGR) enabling the site to be located on an OS map.

Column five indicates the section responsible for the sampling, as some samples are taken by the Pollution Control section and some by Field Control. The logic for this is largely historic and will be reviewed.

Column six indicates frequency of sampling .

Columns seven, eight and nine show the determinand suites (known as ARG's) used and frequency of sampling. The receiving water impact sites are monitored using ARG's SQ40 and S083( for Fish Farms only). The ARG's used for auditing the discharge are also included as information only.

### 5. ENDORSEMENT

The contents of this programme has been agreed by the Water Quality Planner, Field Controller and Laboratory Controller.
