NATIONAL RIVERS AUTHORITY

**WATER RESOURCES DEVELOPMENT STRATEGY
DERIVATION OF MARGINAL DEMANDS**

Supplementary Report No. 3

March 1994 Version 1

Prepared by: M. H. Sitton

Preface

This report is the third in a series of nine supplementary reports which provide supporting information for the National Rivers Authority, Water Resources Development Strategy document;

"An environmentally sustainable water resources development strategy for England and Wales".

The other reports in the series are as follows:

1. Methodology and Assumptions for Public Water Supply Demand Scenarios.
2. Review of Public Water Supply Yields.
4. Other Options.
5. Hydrological Modelling.
6. Resource Scheme Costings.
7. The RESPLAN Model.
8. Environmental Assessment of Strategic Options.
9. National Strategic Overview.

THE DERIVATION OF MARGINAL DEMANDS

1. INTRODUCTION

An important element of the work involved in the data generation process for the water resources development strategy is to define the magnitude of the demands which are to be met from the resource options being considered in the strategy. In order to perform this assessment accurately, and to provide information in an appropriate format for the resource allocation model RESPLAN, it is necessary to consider the resource/demand balance in terms of *demand centres*.

A demand centre is a discrete area of public water supply demand in which specific sources of supply can be used to meet demand within that area.

A demand centre could constitute:

- An entire company distribution network.
- A combination of zones within one or more companies.
- An individual company zone.
- A combination of one or more entire company distribution networks and zones.

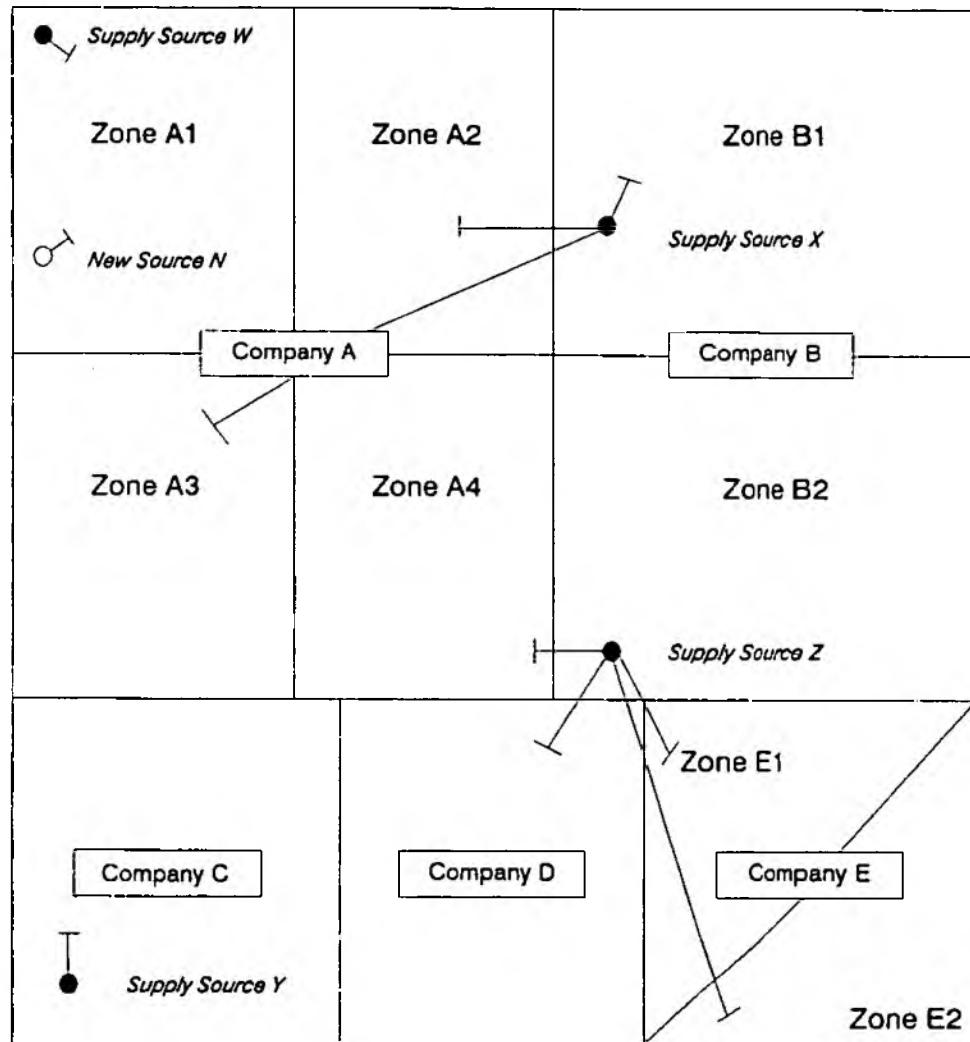

Figure 1 shows the variety of ways in which demand centres can be specified, and how specific sources of supply can be attributed to specific demand centres.

In assessing the future demand/resource balance account needs to be taken of the yield available from existing sources together with that which can be supplied by small non-strategic capacity developments or reallocations local to the centres of demand. These *local developments* can often only be allocated to specific demand centres. For example, in figure 1 an increase in the capacity of supply source W, or the construction of a new source N, may give extra yield available only to company A within zone A1.

In the case of reallocation of existing resources, these can either take place within a demand centre or between demand centres. For example, in figure 1 the proportion of source Z allocated to zone E1 could be increased by decreasing the proportion allocated to E2. The potential for such reallocations is implicit in the amalgamation of yield and demand data necessary to specify a demand centre, however, the specification of a demand centre does not imply that such reallocations will take place in all cases. Reallocation between demand centres may occur by redirecting specific sources of supply. Such reallocations are treated as a "local development".

Any demand which cannot be satisfied by the sum of existing yield, local development and/or reallocation is termed a *marginal demand* and is the deficit which needs to be met from strategic developments. Marginal demand data is the format required by RESPLAN.

Figure 1: The Variations in Specifying a Demand Centre

Demand Centre I = Zone A4, Zone B2, Company D, Zone E1, E2

Demand Centre II = Zone A1

Demand Centre III = Company C

Demand Centre IV = Zone A3, A2, B1

Key:

○ - New Source

● - Existing Source

— - Direction & Termination of Supply Network

2. SIMPLE DERIVATION OF A MARGINAL DEMAND

In order to calculate a marginal demand for a particular demand centre the following data is required:

- plus* Existing yield available to the demand centre
- plus* Future yield expected from any local development
- less* An allowance for operational failure (outage)
- less* Any foreseeable future loss of yield due to other factors
- less* Total demand for public water supply (potable and bulk supplies)

Figure 2 shows the concept of a marginal demand. This figure demonstrates that at point A any increase in total demand will generate a marginal demand. As the demand increases between A and B the marginal demand can be seen to increase.

3. CALCULATION OF MARGINAL DEMANDS

During April of 1993 NRA regions were supplied with information on the specification of demand centres and the derivation of marginal demands together with a request to supply a first set of data. The variations inherent in this preliminary data set were recognised and built into a common spreadsheet format from which further data could be produced in response to changes in demand figures.

The results from these spreadsheets is attached at annex 1. In most cases the marginal demands included in annex 1 were input to the RESPLAN model. In some instances assumptions were made about the inclusion or alteration of specific marginal demands and where this resulted in a change in data from that in annex 1 the difference was documented and is included at appendix 1 in the RESPLAN supplementary report No. 9.

4. STANDARD ASSUMPTIONS ON YIELD REDUCTIONS

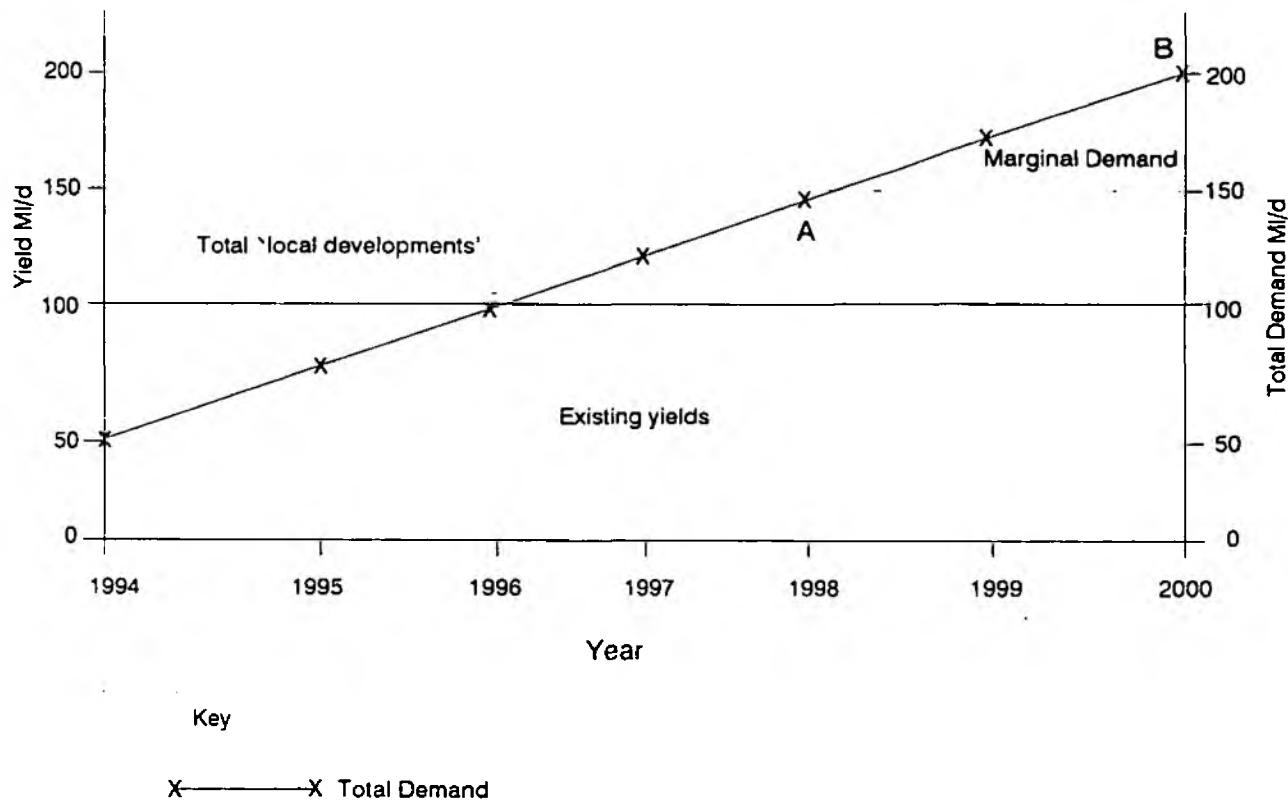

4.1 Outage

A reduction in existing and future yields of 2.5% was allowed to account for safeguards against possible operational failure of sources.

4.2 Environmental cutbacks

Possible reductions in total yield due to low flow alleviation or other reductions on environmental grounds have been included where appropriate. These reductions are indicated on the outputs at annex 1.

Figure 2: The Concept of a Marginal Demand

4.3 Other cutbacks

Potential future loss of yield due to the decommissioning of unreliable or polluted sources has also been accounted for. Where such reductions occur they are identified on the outputs at annex 1.

5. VYRNWY REDEPLOYMENT

Because of the need to represent the redeployment of Vyrnwy reservoir correctly within the RESPLAN model the marginal demand for the model was calculated separately and excluded the Ribble and Huntington local developments. Instead these were included as sources for allocation within RESPLAN. However both Ribble and Huntington are to be regarded as local developments and the output for North West at annex 1 includes them as such. The annex 1 results for North West therefore show the maximum marginal demand given the requirement for redeploying Vyrnwy whilst maintaining a zero deficit within the Southern Command Zone. (NB. This assumes constrained borehole output at 171 Ml/d).

6. AUDIT

The marginal demand results were audited independently and checked for accuracy. The audit report outlines variations which have been build into the calculations because of differences in approach inherent in the original marginal demand submissions from NRA regions. For this reason it represents a useful source document and is included at annex 2.

ANNEX 2

WATER RESOURCES PROJECT MANAGEMENT

MARGINAL DEMAND AUDIT

1 INTRODUCTION

Marginal demands calculations have been undertaken by NRA-HQ, for each NRA Region (Ref 1) to forecast the deficits in yield under three demand scenarios for each water company and, in certain cases, zones within water companies.

Data for the calculations originate from various sources including:

- "Methodology and assumptions for Public Water Supply Demand Scenarios" NRA-HQ October 1993. (Ref 2);
- "Water resources Strategy Review of Public Water Supply Source Yields" Halcrow Draft Report, April 1993 (Ref 3);
- June 1993 "Water Company Consultation Paper" (Ref 4);
- Correspondence between NRA Regions and NRA-HQ.

A spreadsheet computer program has been used to calculate the marginal demands for each water company or zone of a water company.

2 OBJECTIVES

The purpose of the audit was to:

- 1) Check the source data;
- 2) Check that transcription errors have not occurred between the source documents and the spreadsheet;
- 3) Check the methodology used within the spreadsheet to calculate the marginal demands.

NRA regions whose marginal demands will have a particular bearing upon the RESPLAN study were examined to a greater level of detail than others. These regions include Anglian, North West, Severn Trent, Southern, Thames and Wessex.

In certain cases, audit trails only led as far as information sent from NRA Regions. To check this information further would require auditing each region separately.

METHODOLOGY

The audit was broken down into the following areas:

- a) Existing yield data;
- b) Demand forecast data;
- c) Local schemes, bulk supplies to industry, transfers and yield cutbacks (due either to environmental or operational reasons);
- d) The method of calculation.

Comments on the marginal demand calculations are provided for each NRA region and on the calculations as a whole. These comments were then discussed at a meeting between Mark Sitton of NRA-HQ and Brian Darling of Halcrow on the 1 December 1993. The following audit report details the comments made and the appropriate response required. The responses fall into three categories as shown below:

Category	Response
(I)	Significant action
(II)	Insignificant action
(III)	No change

NOTE: in (I) and (II) above the difference between a significant and insignificant action is whether the action will impact the final marginal demands figures. Actions which are insignificant are still important but may involve a cosmetic change to the tables to make them clearer rather than a change to the final numbers. Other insignificant actions may regard changes to other documents such as the Halcrow yield tables (Ref 5).

AUDIT FINDINGS

In most cases the findings of the audit will make little difference to the final marginal demand figures. Most of the findings relate to the way the information is presented in the spreadsheet and the information supporting the calculations.

Findings which will change, or could potentially change, the final marginal demands have been labelled as category (i) in the response section for easy reference.

Findings which relate to the marginal demand calculations in general are outlined in Table 1. Those which relate to specific NRA Regions are listed under each individual region in Table 2.

Table 1
GENERAL AUDIT FINDINGS

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
1	For many regions the complete list of potential local schemes has been included for the marginal demand calculations regardless of how promotable the scheme is perceived to be.	(i) Significant Action. It is suggested that a run of RESPLAN is undertaken assuming marginal demands based on a reduced contribution from local schemes.	NRA-HQ
2	For many regions the calculations assume that the local schemes or transfer works can be constructed immediately regardless of planning horizons.	(i) Significant Action. The Local Schemes should be classified into time scales of possible promotion and new marginal demands derived for use in a sensitivity analysis.	NRA-HQ
3	The definition of what is included in Distribution Input has a significant impact on the way bulk supply demands from industry are dealt with.	(ii) Insignificant Action. The OFWAT definition of Distribution Input (DI) includes all potable water distributed by a water company. Certain bulk supplies to industry such as Fawley Oil Refinery in the Wessex Region have been included in the DI, where it could be argued that the water is not of potable standard. These anomalies need to be identified and accounted for.	

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
4	The format of the calculations change between region. In particular, the meaning of bulk supplies differs between regions. In some cases it means an industrial transfer which is only added to the demand figures, whereas in others it relates to an inter-company transfer which is added and subtracted from yield figures.	(ii) Insignificant Action. Define more clearly what is meant by bulk supplies.	NRA-HQ
5	Inter-zonal transfers are assumed in certain regions such as Southern and Severn Trent but not in others such as Thames.	(iii) No change. Deficits in the Thames region are assumed to be met by the strategic schemes assigned by RESPLAN.	
6	There are minor discrepancies of about + or - 2 MI/d in the final marginal demand figures.	(iii) No change. This is considered to be sufficiently accurate.	

Table 2
REGIONAL AUDIT FINDINGS

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
ANGLIAN REGION			
1	The existing yield figures for Anglian Water Services (AWS) and Essex Water Company each differ by 2 MI/d from the yields quoted in the latest Halcrow yield tables (Ref 5)	(ii) Insignificant Action. The 2 MI/d difference is within the accuracy limits of the study. However, Halcrow should update the yield tables for consistency.	Halcrow
2	The local schemes for Anglian Region include 40 MI/d increased abstraction from chalk. Is this included in the original yield figures provided by NRA Anglian Region?	(iii) No change. No, the 40 MI/d yield is additional to the existing yield figures provided.	
3	The total planned yield figure for Anglian Water Services should be 1643 MI/d rather than 1607 MI/d. 1643 MI/d includes the additional yield from the Trent of 36 MI/d.	(ii) Insignificant Action. Total planned yield figure to be corrected. However, calculations actually used the correct figure so this has no impact on final marginal demands.	NRA-HQ
NORTHUMBRIA REGION			
1	North East Water (NEW) provides a 38 MI/d bulk supply to Northumbrian Water. The 38 MI/d is included as a demand on North East Water but is not added to Northumbrian Water's yield figure.	(i) Significant Action. M Sitton to ring D. Archer to check where the 38 MI/d goes.	NRA-HQ
2	The 13 MI/d Unallocated Kielder Local Scheme for NEW is the additional amount of Kielder surplus required by NEW by 2021.	(iii) No change	
NORTH WEST REGION			
1	Constraining the SCZ boreholes from 239 MI/d to 171 MI/d is open to question.	(iii) No change. The 171 MI/d has been used by NRA-North West Region for the MOSPA modelling and is therefore assumed to be reasonable.	

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT

NO	FINDING	RESPONSE	ACTION
2	Why is the 80 MI/d bulk supply from the River Dee added to the RR zone demand figures rather than the SCZ figures?	(iii) No change. The 80 MI/d industrial demand has been included in the RR zone on purpose to remove the 80 MI/d bulk supply from the redeployment equation. An equivalent yield has been included in the RR zone to cover this demand.	
3	The LCUS increase in yield by 80 MI/d is in considerable doubt since the existing level of abstraction is already leading to environmental problems.	(iii) No change. NRA propose no change. However, it is suggested that this should be considered further - it is a specific example of the first point raised in Table 1.	

SEVERN TRENT REGION

1	Discrepancies occur between the existing yield figures adopted for each Severn Trent zone and those given in the latest Halcrow yield tables (Ref 5).	(ii) Insignificant Action. Halcrow to update the existing yield tables to conform with the latest Severn Trent information.	Halcrow
2	The 2.5% outage allowance is not deducted from the 1991 Severn Trent yield figures, as is done for other regions.	(iii) No change. Outage is not included for 1991, because the data is now historic and it is therefore unrepresentative of reality to have a marginal demand which never occurred.	
3	What does S and C stand for in the Local Scheme Table?	(iii) No change. S = Shropshire Groundwater Scheme C = Carsington Reservoir deployment of yield.	

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
4	There is an addition error on year 2021 column of the AMP2 and lost yield reductions tables. It reads 65.01 instead of 175.01.	(ii) Insignificant change. Table to be corrected.	NRA-HQ
SOUTHERN REGION			
1	Proposed yield figures are adjusted from the existing yields by transfers between water companies and water company zones. These transfers are entered under 'Bulk supply and other commitments' and balance the surpluses and deficits within the region.	(iii) No change.	
2	The transfers in 1) above assume that water companies with surpluses co-operate in supplying transfers to neighbouring water companies with deficits.	(iii) No change This assumption is made following initial negotiations within the Southern Region.	
3	The promotability and time scale of promotion of certain local schemes is in doubt. The Halcrow Yield Report (Ref 3) comments that Local Groundwater for Mid Kent Water Company is unlikely to be approved for development and that Havant Thickett and Chillerton Reservoirs would not be developed before 2021.	(iii) No change. A sensitivity analysis is thought necessary to test RESPLAN for marginal demands based on a reduced contribution from local schemes. (see General Audit Findings).	
4	The 'High demand scenario' demand figures for Mid Kent Water Company in 2016 and 2021 disagree with the figures given in the 'PWS Demand Scenario Report' (Ref 2).	(i) Error to be corrected.	NRA-HQ
SOUTH WEST REGION			
	No comments.		

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
THAMES REGION			
1	The demand factors used to derive the proportion of demand within each zone of TWUL are not shown on the spreadsheet.	(iii) No change. Individual demand calculations were undertaken for each zone using the NRA-HQ method as described in Ref 2. The proportion of the total demand was then used to pro-rata the overall demand figures to give the demand in each zone.	
2	If existing yield figures for the London zone are compared with the demands in 1991 a deficit for the zone is shown.	(iii) No change. In reality, historic existing yields were greater due to the 2.5% outage not being required.	
3	Transfers between zones within TWUL would reduce deficits for the 'high' and 'medium' demand scenarios. For example surpluses within the Guilford and Reading zones could offset deficits in the Oxford and Swindon, or London zones.	(iii) No change. The transfer infrastructure is assumed not to exist between zones.	
4	Environmental cutbacks for the Darent and Cray sources have already been included in the yield figures. This should be made clear the Halcrow yield report.	(ii) Insignificant Action. Halcrow to change yield report.	Halcrow

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT			
NO	FINDING	RESPONSE	ACTION
WELSH REGION			
1	Are the new Dee developments for Chester and Wrexham Water Companies already included in the Dee developments for NWW to replace Vyrnwy?	(ii) No change. NWW already have a licence for future Dee abstraction. Dwr Cymru have applied for a licence for the 70 MI/d surplus yield from the Dee, however, the licence has not yet been granted. The 10 and 11 MI/d Dee abstraction Local Schemes for Chester and Wrexham are assumed to be available from the 70 MI/d surplus and are designed to meet forecast deficits.	
WESSEX REGION			
1	The 11.3 MI/d bulk supply from Bristol Water to Wessex Water, is included in the yield figures of both Bristol Water and Wessex Water and as a demand to both Bristol and Wessex Water companies. Hence if the yield or demand figures are taken separately then the 11.3 transfer would be double accounted. Also the 2.5% outage is removed twice from the 11.3 MI/d.	(ii) Insignificant Action. To conform with the accounting method adopted in the Halcrow Yield Report the 11.3 MI/d should not be included in Bristol Water's yield or demand figures.	NRA-HQ
2	The existing yield figures used are different to the latest Halcrow yield tables.	(ii) Insignificant Action. Halcrow to alter the yield tables so that they conform with the latest yield information provided by NRA Wessex Region.	Halcrow
3	Bournemouth and West Hants Water Company industrial supply to Fawley Oil Refinery has not been included as a bulk supply in the marginal demand calculations.	(iii) No change. The supply to Fawley has been included in the Distribution Input by Bournemouth and West Hants Water Company and therefore is included in the PWS demands.	

WATER RESOURCES PROJECT MANAGEMENT - MARGINAL DEMAND CALCULATIONS AUDIT

NO	FINDING	RESPONSE	ACTION
YORKSHIRE REGION			
1	The existing yield figures used are different to the latest Halcrow yield tables.	(i) Significant Action. The existing yield figures for the Yorkshire Region may change. The Marginal Demand Calculations and the latest Halcrow yield tables should be updated when new yield data is received from NRA Yorkshire Region.	NRA-HQ Halcrow
2	The Washburn Valley and Operational Changes Local Schemes each have a yield of 50 Ml/d in the Marginal Demand Calculations. These have both been estimated to have a yield of 32 Ml/d each in the Halcrow Water Resources Study of the Yorkshire Region.	(i) Significant Action. NRA Yorkshire Region to be consulted to obtain the correct yield figures for these schemes.	NRA-HQ
3	The environmental cutbacks for the Selby Boreholes and Derwent Agreement of 40 Ml/d until 2001 should be noted under the environmental cutback section.	(ii) Insignificant Action. A note of explanation is to be added to the marginal demand calculations.	NRA-HQ
4	The existing yield figures for Yorkshire Water in 1991 and 1996 do not include the 2.5% outage contingency.	(ii) Insignificant Action. Yields of Yorkshire Water in 1991 and 1996 are to be altered.	NRA-HQ

5 RECOMMENDATIONS

The audit findings which require action are indicated in Tables 1 and 2. Findings which have a category (I) in the response column require action before the marginal demand figures can be used for the final RESPLAN runs. Category (II) findings in the response column should be implemented before the reporting stage of the project to ensure the consistency of the calculation tables.

In their present state the calculations on their own could be misinterpreted if used in the future. It is therefore recommended that this audit report is attached to the calculations when filed and that supporting documentation for the calculations is fully referenced.
