Introduction

Welsh Water continuously published catch data since 1974 and a useful archive of reported catches has continued to accumulate.

In September 1989 responsibility for Fisheries passed to the newly formed National Rivers Authority, and this new volume brings the series up to date with 1988 catches for both rods and nets as reported by fishermen.

It is stressed that these data can do no more than show the number of fish declared on catch returns and must therefore be treated with some caution. Their greatest value is in helping to identify trends of catches both in particular rivers and through Wales as a whole.

Effort data for commercial instruments are included here for the first time.

Catch data, as presented here, do not themselves represent the size of the stock of a particular river. Indeed the relationship between catch and stock is not at all clear and might be expected to vary considerably from river to river and year to year. The total river stock of adults must also include those entering the river after the close of the fishing season. Clearly there can be no catch data for this component of the resource and indeed little is known of its size.

Investigations are currently under way to identify the most useful way to record and present fishing effort for rod fishing. As a result, the more meaningful statistic of Catch Per Unit Effort, which gives an indication of yield or density of the stock, can be calculated. It is hoped that in the future, rod effort and catch per effort will be presented with catch data.

Overall reported catches for both salmon and sea trout were excellent in 1988. The most notable figures are for salmon rod catch - the total is the highest for approximately 20 years. This was principally due to the consistently ideal conditions for salmon fishing. Other factors e.g. increased sea survival may be contributory, though this cannot be quantified. It is also believed that more effective enforcement strategies and legislation have had a significant impact. Total sea trout rod catch is the second highest on record though it is thought that an increased willingness to report sea trout over recent years is an important factor here.

Reported figures for commercial instruments are the highest for salmon since 1981 and the highest for sea trout since 1984, so 1988 can be regarded as a good season for both anglers and netmen.

The reminder system continues to be used to secure information from the many anglers who neglect to submit a voluntary return at the end of the season. We are very grateful to all those who sent in details of their catches both pre- and post-reminders.

Please do not hesitate to let us know if you have any useful ideas which may help us to improve whether the reminder system itself or the way in which it is reported.
