1. INTRODUCTION

This is the third publication of the annual catch statistics produced by the Welsh Region of the NRA and extends the number of years for which such a document has been produced to 17. The figures contained herein are based upon the details of catches of salmon and sea trout as submitted by both netsmen and anglers on their statutory catch returns. Anglers are required to submit their returns upon the expiration of their licence or at the end of the fishing season, the netsmen however are required to make monthly returns.

It must be stressed that the number of fish referred to is the declared catch, are therefore minimum figures and hence should be treated with caution. The figures are useful for comparative purposes with past years data and may indicate catch trends in specific rivers or throughout the Welsh Region as a whole, however their relationship to stock size is unknown.

The return rate for rod and line catch returns was similar to previous years with 60% of migratory salmonid licences sold having an associated return submitted after reminder letters had been issued to 11021 licensees. The category for which the highest return rate was recorded was that of the concessionary licences with a 76% return rate.

The reported rod catches (including the Wye Owners Returns) for both salmon and sea trout were lower in 1990 than in 1989 which was recognised as a very poor year for rod and line fishing. The salmon catch fell to 5370 fish, a decrease of 2% on the 1989 catch, the sea trout catch suffered a decline of 24% over the same period, the 1990 catch being 10034 fish.

Whilst there is much speculation as to the reason behind the decline in catches, it would appear that for the second year in succession the anglers in the region have been thwarted by an extremely dry summer and consequently there have been fewer spates and therefore lower numbers of fish entering the rivers during the summer months. Concern about the lack of fish was relieved a little during the last fortnight of the season when 28% of the annual salmon catch in 1990, and 10% of the annual sea trout catch was reported to have been taken.

The reduction in catch was also shown by the net fishermen who reported 16% fewer salmon in 1990 than in 1989 and a 45% reduction in the sea trout catch over the same period.

It is important to note that the decline in catches may be attributable to a corresponding decline in fishing effort. Although licence sales have remained relatively constant, the number of days actually spent fishing may have decreased due perhaps to anglers waiting for higher flows and consequently a better chance of catching fish. Included in this report for the first time are details relating catch and fishing effort. Section 5 gives details for each river of the number of salmon and sea trout caught per day and per return during 1990. Only those returns which were completed accurately were used in these calculations. From these figures can be shown that in 1990 it took on average 47 days (visits) to catch one salmon and 20 days (visits) to catch one sea trout.

Once again, the Authority is grateful to all those who submitted their catch returns both pre and post reminder.
