**EC URBAN WASTE WATER TREATMENT & NITRATE DIRECTIVES****Candidate Sensitive Area [Eutrophic] / Polluted Waters [Eutrophic]****FORM A: COVER SHEET***(use for all types of SA/EI/PW/EI)*

- 1) Name of regulator: Environment Agency, South West Region, Devon Area  
*(see note 1 on guidance sheet)*
- 2) Candidate name: Taw Estuary
- 3) Main river catchment: River Taw  
*(see note 2 on guidance sheet)*
- 4) Location & extent of candidate: From the top of the estuary at:  
NGR: SS 5695 2832 River Taw at Newbridge  
To the mouth of the Taw estuary at:  
NGR: SS 4700 3200 Off Crow Point  
*(map should be included, see note 3 on guidance sheet)*
- 5) Type of candidate (tick box):

Still freshwater	<input type="checkbox"/>
Running freshwater	<input type="checkbox"/>
Estuary	<input checked="" type="checkbox"/>
Coastal	<input type="checkbox"/>
- 6) Is the candidate: Sensitive Area [Eutrophic]   
Polluted Water [Eutrophic]   
Both
- 7) Is the candidate: Eutrophic now

At risk of becoming eutrophic

(see note 5 on guidance sheet for definitions)

8) In May 1994, was the candidate :

- Designated as an SA[E]   
Withdrawn/not designated due to insufficient evidence   
Not proposed

9) Summary of qualifying discharges (ie greater than p.e 10,000 - see note 6 on guidance sheet)

Name of discharge	Direct/Indirect	NGR	Population Equivalent	Current level of treatment
-------------------	-----------------	-----	-----------------------	----------------------------

Barnstaple (Ashford) Direct SS5325 3406 64500  
(DWF 10314  
 $m^3 / day$ ) Primary Settlement  
Baff Plant

Discharge to estuary

\*

\* UV treatment due to be installed mid 1997.

Now progress to the relevant form for the Sensitive Area, also submitting a form F for each qualifying discharge

Form B - Running Freshwaters

Form C - Still Waters

Form D - Estuarine

Form E - Coastal

Form F - Effects of nutrient removal at qualifying discharge

**EC URBAN WASTE WATER TREATMENT & NITRATE DIRECTIVES**  
**Candidate Sensitive Area [Eutrophic] / Polluted Waters [Eutrophic]**

**FORM D: ESTUARINE WATERS - Information & Data**

1) Candidate name      Taw Estuary

2) Extent of SA[E]/PW[E]

Start point	Newbridge on River Taw	Start NGR	SS 5695 2832
-------------	------------------------	-----------	--------------

End point	Off Crow Point	End NGR	SS 4700 3200
-----------	----------------	---------	--------------

Length    23 km

3) Attach map showing SA[E]/PW[E] and locations of chemical sample points, biological sample points, any qualifying discharges and any other significant discharges.

4) Approximate retention/ flushing time      days

Order of 2/3 days, but can be highly variable depending on river flow.

5) Brief description of geomorphological nature of estuary (*eg. broad and flat, deep and fjord-like, salinity regime, stratification etc*)

The Upper reaches of the estuary occupy a narrow winding channel with a typically muddy substrate. The middle and lower reaches are broad, although at low tide the water occupies narrow channels, bordered by intertidal mud and sand banks. The bottom end which is joined by the Torridge estuary is short and broad, having extensive sand and gravel banks. A substantial sand bar across much of the mouth is exposed at low water (see detailed map).

Above Barnstaple, the estuary is semi riverine, ie. it experiences tides while being predominantly freshwater with surface salinity typically below 5 practical salinity units (PSU), for most of the tidal cycle. The extent of this low salinity area within the estuary is sensitive to river flow, with high river flows causing freshwater to move further down the estuary. Within this vicinity, particularly following sudden increases in river flow, the water can become stratified with lower salinity water overlying higher salinity water with limited vertical mixing of the water bodies. These features are not permanent in part due to the very shallow channels present at low water. By contrast, the bottom end of the estuary which includes the Torridge estuary is dominated by the influx of coastal water and is vertically well mixed showing no significant differences in salinity through the water column (see detailed map).

The Taw estuary provides a recreational area for a wide range of activities for both local people and tourists. There is a well developed system of public footpaths and cycling routes around the entire estuary. This is better known as the Tarka Trail and provides reasonable access to the estuary and coastal surrounds for bird watchers. Angling takes place throughout the estuary both from the shore and boats. Boating incorporates a

variety of leisure activities and is largely concentrated at the lower end of the estuary around Appledore, Crow Point and Instow.

Mussels, oysters, cockles and winkles all grow naturally on the many areas of shellfish beds within the Taw estuary. Commercial exploitation of shellfisheries within the estuary was a valuable industry however, shellfish harvesting for commercial purposes is restricted under the EC Shellfish Hygiene Directive(91/492/EEC) due to microbiological contamination of shellfish flesh. Under the EC Shellfish Hygiene Directive, shellfish harvesting in the estuary has been identified as either Class C, where shellfish require long periods of relaying prior to marketing, or Class D where shellfish harvesting is prohibited.

The estuary has runs of salmon and sea trout from May to September en route to the main spawning beds within the R.Taw catchment.

6) Summary of main uses and designations (*tick boxes*)

Amenity	✓	Boating	✓
Watersports	✓	PARCOM potential problem area	✓
EC Bathing Water	✓	Angling	✓
Passage of migratory fish	✓	Designated EC Shellfish Water	
Designated EC Shellfish Harvesting Area	✓	Non - designated shellfish harvesting area	✓

Other designations and uses (*specify - see guidance note 22*)

7) If watercourse has conservation status provide details (*see guidance note 23*) :

The estuary was renominated as a SSSI in 1988. There is a RSPB reserve at Isley Marsh. South of the estuary mouth is an area of sandy beach, pebble ridge and the sand dunes of Northam Burrows which has been notified as a SSSI and an AONB. North of the estuary, Braunton Burrows, an extensive area of sand dunes have been identified as a NNR and a United Nations Educational, Scientific and Cultural Organisation (UNESCO) Biosphere Reserve (see detailed map).

8) What chemical data are available ?

(*tick boxes if evidence is supplied - see guidance note 24*)

Dissolved available inorganic phosphorus

Dissolved available inorganic nitrogen

Chlorophyll a                    see Appendix A  
Cell counts                    see Appendix B

- 9) What biological / observational data are available ?  
*(tick boxes if evidence is supplied - see guidance note 25)*

Macroalgae                    see Appendix C  
Planktonic algal blooms    see Appendix B  
Sh'fish/inverteb./fish mort.    see Appendix D  
Appearance of scum/foam    see Appendix E  
Photographs                   

- 10) Which of the DoE numeric criteria are exceeded?

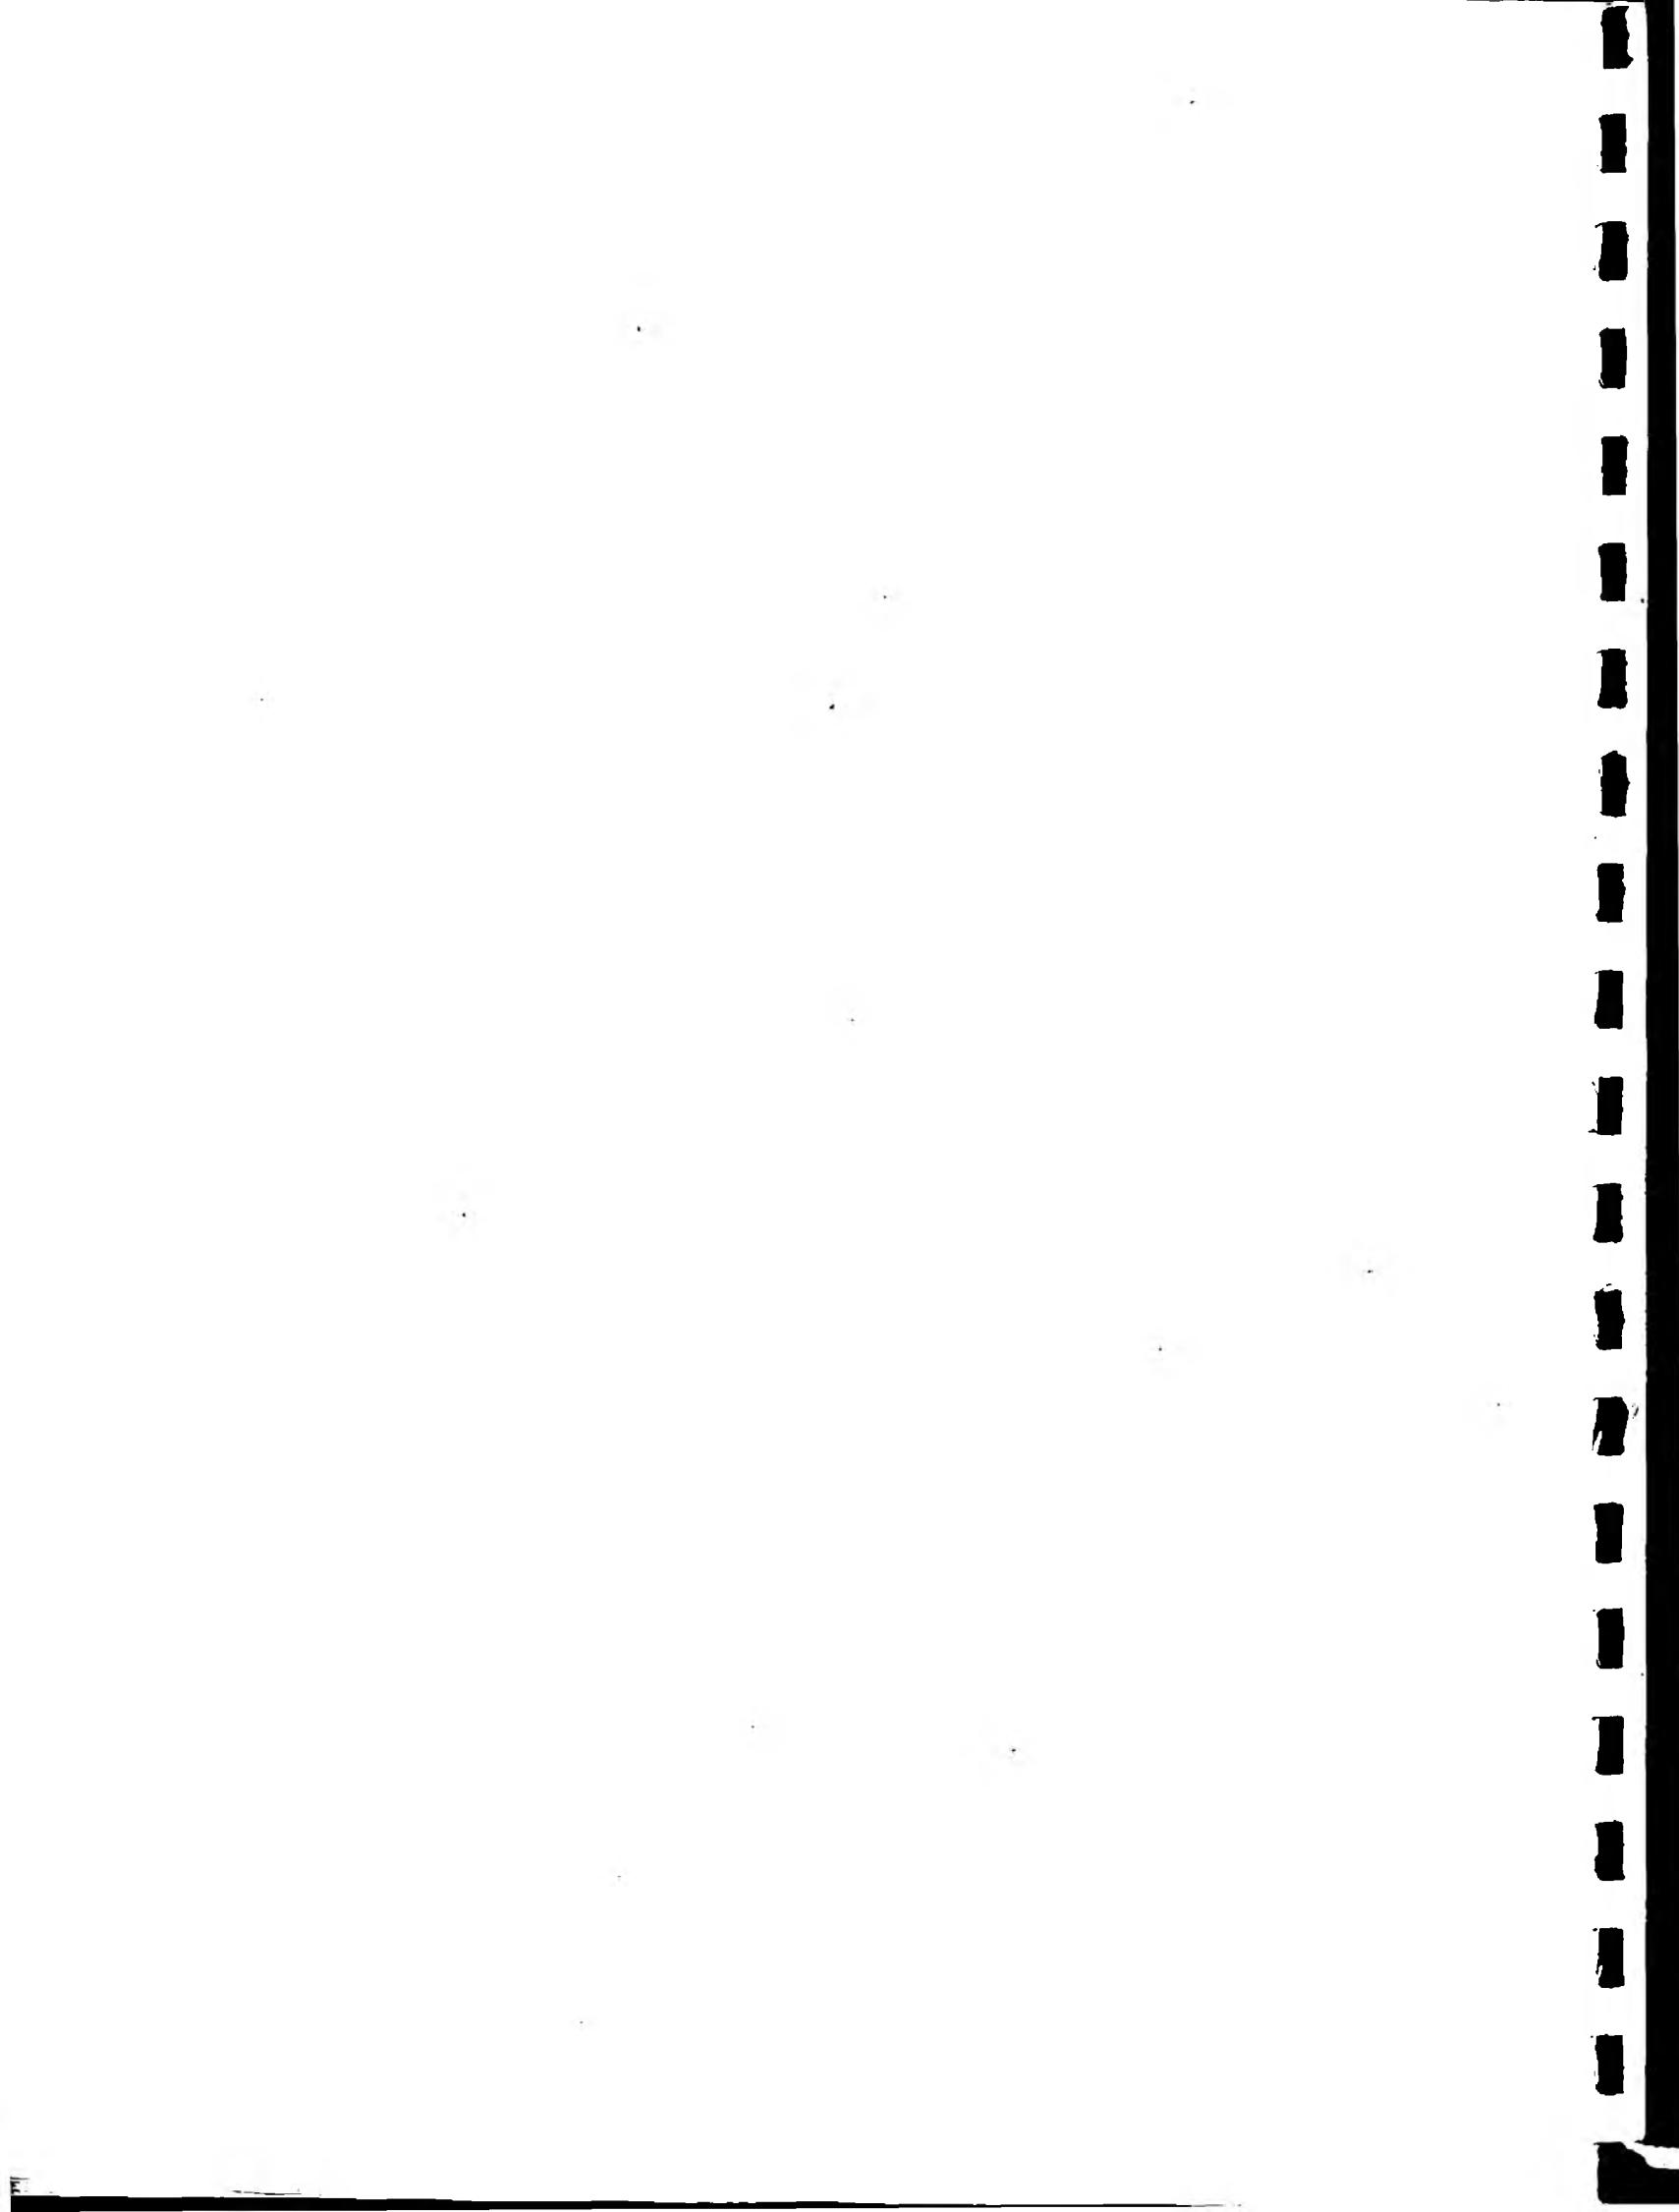

Chlorophyll a                     
Cell counts                   

- 11) Other evidence of adverse effects *(see guidance note 26)*

No adverse effects have been reported concerning the uses identified under Q6. Within the estuary samples are collected under the Dangerous Substances Directive as well as the UWWTD. Under the Dangerous Substances Directive there are no exceedences of standards. PARCOM sampling was undertaken from Barnstaple (Ashford) STW between 1991 and 1993 with no adverse effects noted, however the STW does receive industrial effluent so the potential exists. A number of complaints have been received by members of the public concerning bloom sightings. These are detailed under Appendix F. Photographic evidence of bloom conditions are included as Appendix E.

- 12) Executive summary of the chemical, biological and other evidence illustrating eutrophication in the SA[E]/PW[E] *(see note 27 in the guidance sheet).*

Evidence of eutrophication as follows: spot sample chemical data - elevated DO% readings during summer daytime sampling; enhanced winter nitrogen concentrations to background - see Appendix A. Continuous chemical data - diurnal fluctuations during summer months - see Appendix G. Biological data - Chlorophyll A values exceeding 10ug/l - these values have been graphically illustrated and clearly show very high Chlorophyll A levels associated with summer months; bloom densities in excess of 5x10<sub>5</sub> cells/l - see Appendices A and B. In addition there is photographic evidence of algal scum - see Appendix E. The sequence of

photographs shown indicates a algal scum slick covering a distance of approximately 7 km i.e from sampling site E30A8 to just above sampling site E30A6 - see enclosed map. Slicks of this nature are common in the estuary as indicated by the complaints enclosed under Appendix F and are clearly visible from the banks of the estuary.

- 13) Summary of eutrophication control measures (already in progress and/or already planned) if any, for the candidate area. (*see note 28 on the guidance sheet*).

N/A

---

---

---

---

---

---

---

- 14) If the SA[E]/PW[E] has previously been designated, is there any evidence to suggest that its status has changed (eg. it is no longer eutrophic) or that the control measures have been effective?

**EC URBAN WASTE WATER TREATMENT & NITRATE DIRECTIVES****Candidate Sensitive Area [Eutrophic] / Polluted Waters [Eutrophic]****FORM F: EFFECTS OF NUTRIENT REMOVAL AT QUALIFYING DISCHARGE**

Name of qualifying discharge (> 10,000 PE)	Direct/Indirect (see guidance note 29)	NGR	Population Equivalent	Current level of treatment
Barnstaple (Ashford)	Direct	SS 5325 3406	64,500	Primary Settlement  Baff Plant  Discharge to Estuary  *

\*UV Treatment due to be installed mid 1997.

- 1) Name of Candidate Sensitive Area [Eutrophic] Taw Estuary

- 2) Type of candidate (*tick box*):

- |                    |                                     |
|--------------------|-------------------------------------|
| Still freshwater   | <input type="checkbox"/>            |
| Running freshwater | <input checked="" type="checkbox"/> |
| Estuary            | <input type="checkbox"/>            |
| Coastal            | <input type="checkbox"/>            |

- 3) Summarise the evidence of the impact of the discharge (eg compare chemical and biological data upstream and downstream of the sewage discharge - see guidance note 30)

Summary details of biological and chemical surveys carried out are as follows:

Chemical - Spot samples were collected from eight sites, four from within the estuary and four from freshwater inputs - estuarine:- E30A8, E30A7, E30A6, E30A5; freshwater:-

R30A002, R30A006, R30A004, R30B005 (see detailed map). Of the four sites within the estuary, two were continuously monitored - samples were collected between 1994 and 1996. Biological - Macrofaunal surveys were carried out within the estuary during 1992 from subtidal and intertidal sand areas. Phytoplankton samples were collected from the same sites used for chemical monitoring within the estuary. Macroflora aerial surveys were carried out over the entire length of the estuary during 1995 and 1996. There was no significant difference between upstream and downstream data.

- 4) Summarise the results of any nutrient removal modelling or other impact assessments carried out for this discharge or, if relevant, for the whole catchment. (see guidance note 31)

Nutrients involved for modelling purposes were nitrogen in the form of TIN (Total Inorganic Nitrogen) and TON (Total Oxidised Nitrogen). The model used was EcoS, a 1-D model developed by Plymouth Marine Laboratory. Data covered the period from the 1st Jan 1994 to the 31st October 1996. For part of the report, only data for 1995 was used as this was the only complete calendar year available. Although there are three effluent discharges into the estuary - Velator, Yelland and Ashford (see detailed map and Appendix H) only the impact of nutrient removal at Ashford was modelled. Velator will be connected to Ashford within 18 months and it is planned to connect Yelland to a new STW at Cornborough with a marine outfall by 2000.

Modelling results for 1995 show:- a) the four sites within the estuary showed elevated nitrogen levels during the winter months - see Appendix I; b) the same sites during the summer months showed decreased levels of nitrogen when the nutrient loadings from Ashford were suppressed - see Appendix J; c) a similar situation arose from two modelled sites located 500m upstream and downstream of the Ashford discharge except this covered the whole of 1995 - see Appendix K.

- 5) Do the benefits of nutrient removal at the qualifying discharge depend on nutrient removal at other discharges? (see guidance note 32)

Although there is loading from other discharges i.e. Yelland and Velator, their impact was not considered since, as indicated in 4) above, the nature of the current discharge regime will change. These changes will increase the loading from Ashford but reduce the overall loading to the Taw estuary.

From the detailed map it is clear that the Taw estuary is influenced by the Torridge estuary. There is one significant discharge that enters the lower end of this estuary, Bideford Fine Screening (see detailed map) and there is therefore the possibility that the effects of this discharge could contribute to the eutrophic conditions observed in the Taw estuary (it should be noted that the algal blooms observed (Appendix E) are not seen in the Torridge estuary). This discharge is due to be connected to Cornborough by 2000.

From the results shown in Appendix L, there is evidence suggesting higher TON levels associated with lower saline levels. This would indicate that the freshwater input into the estuary from the main R.Taw and smaller freshwater discharges contribute to the

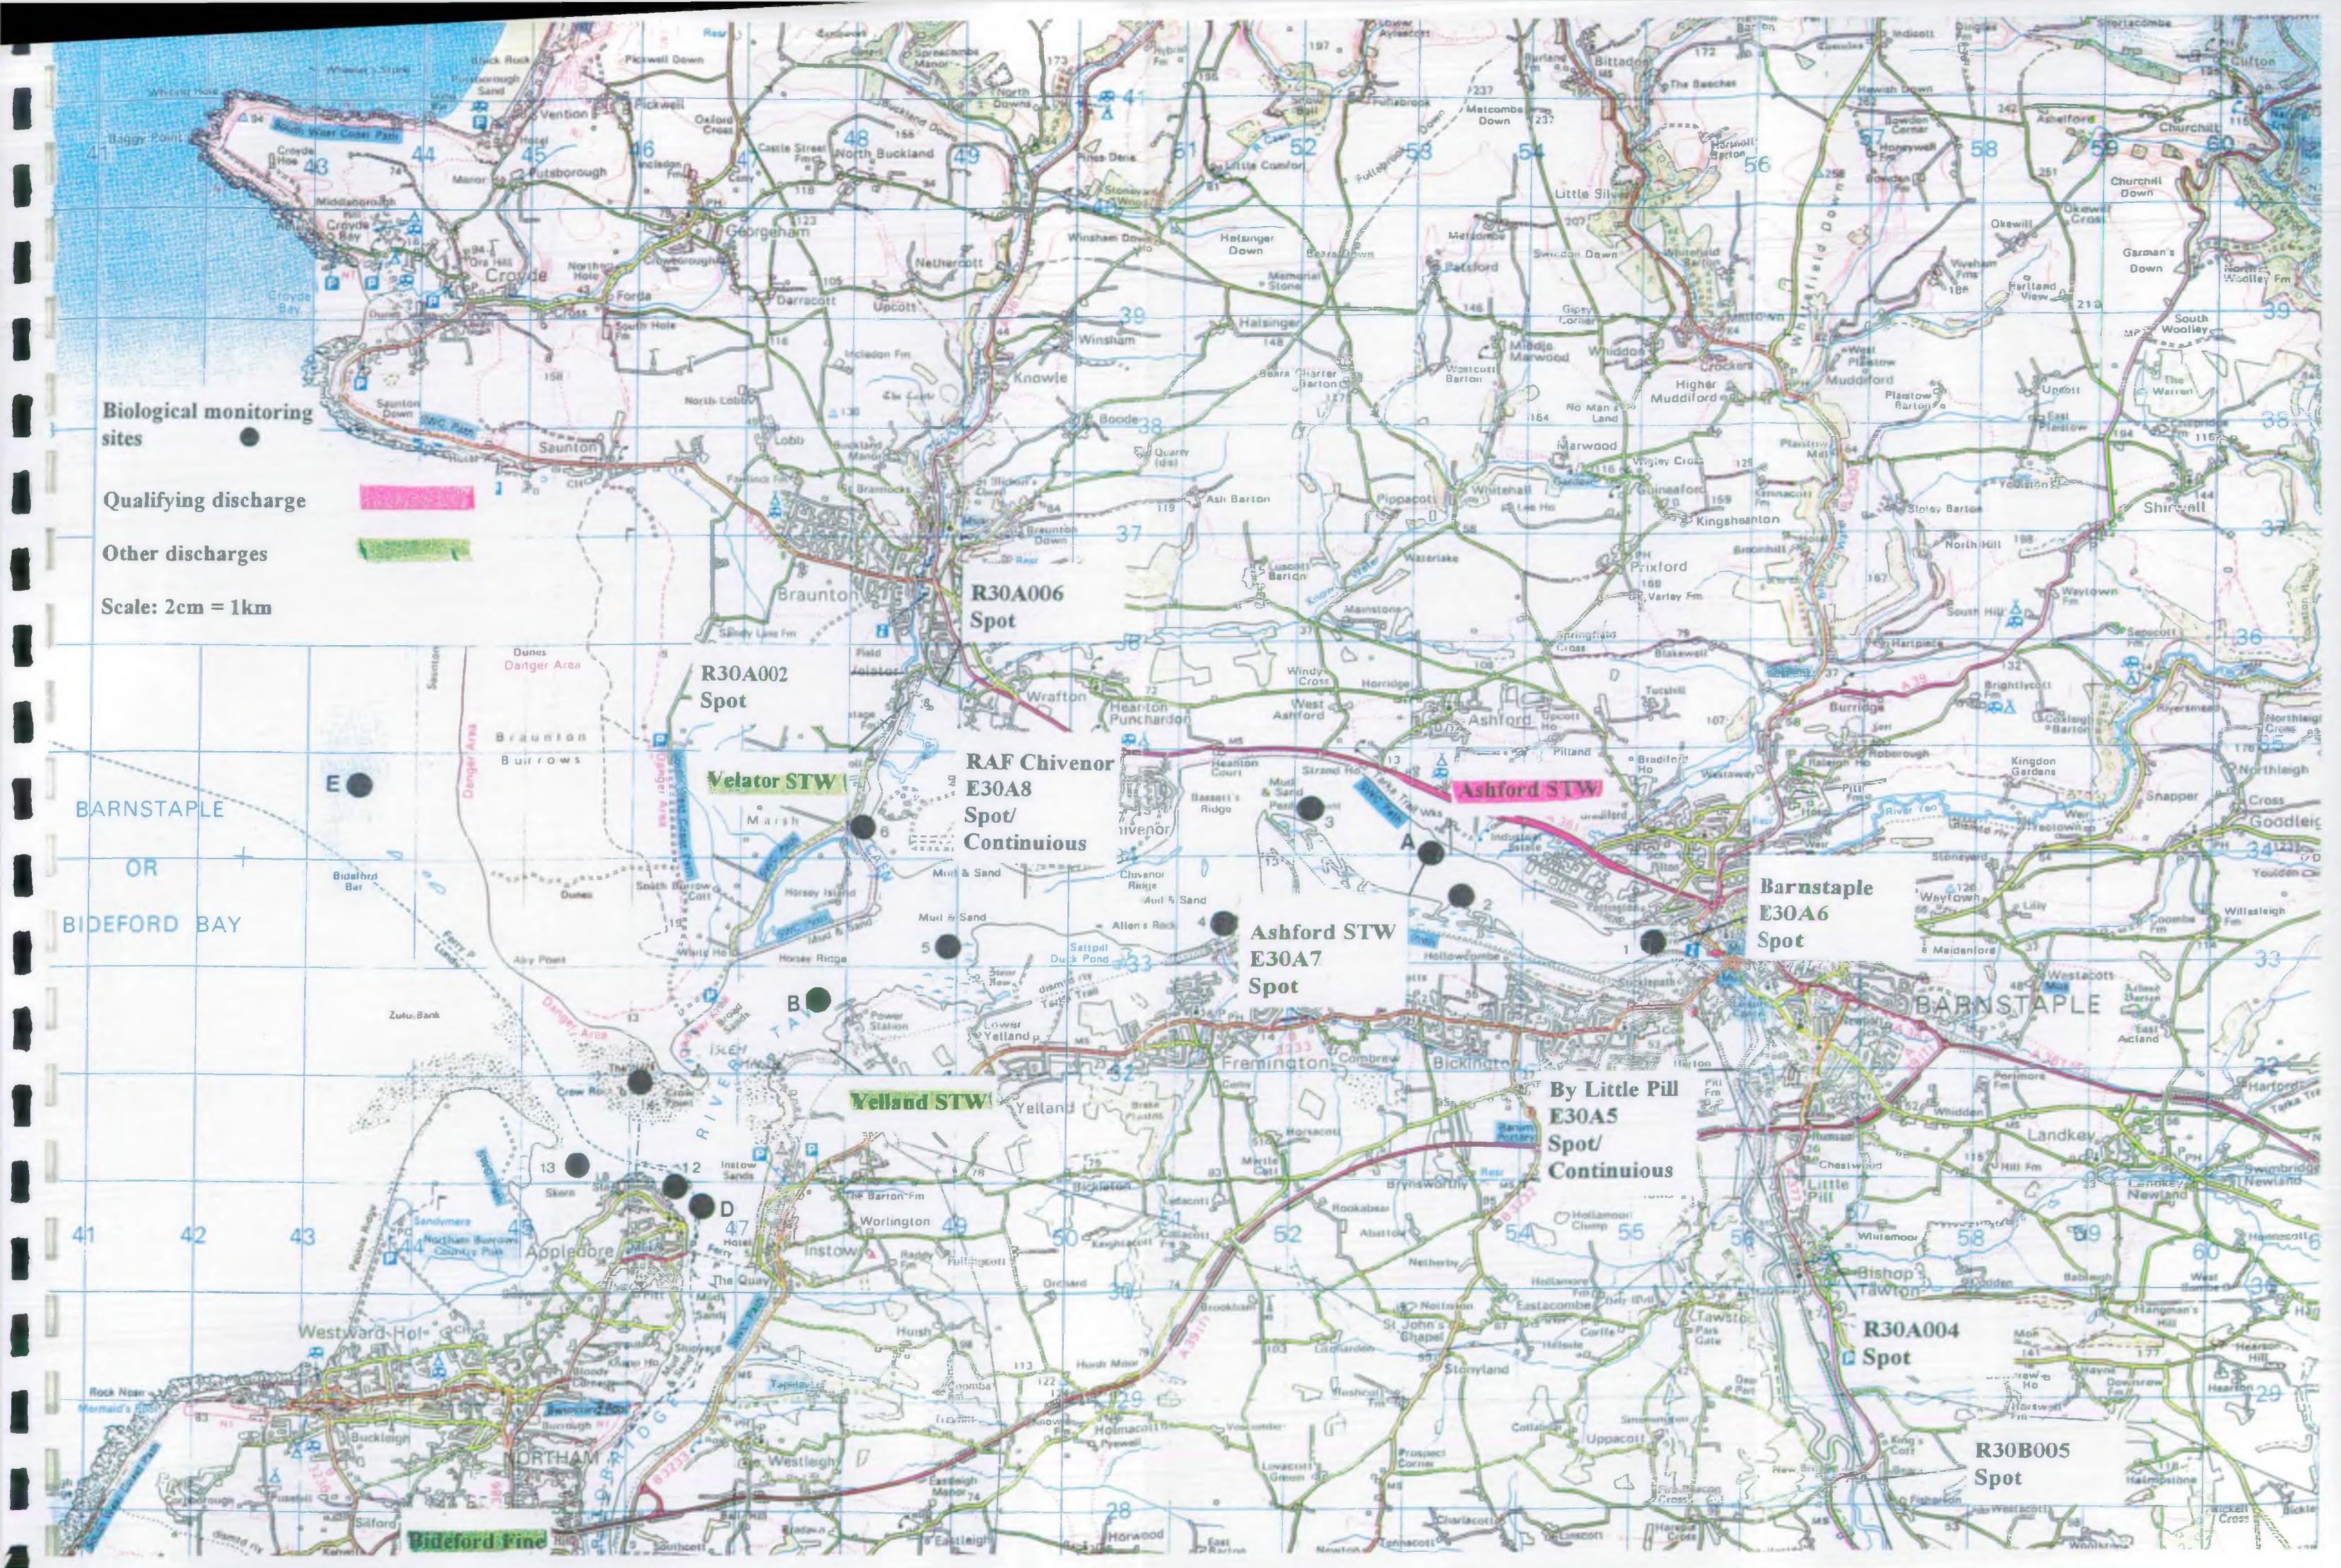

nutrient loading. The entire Taw catchment is an area of intensive dairy farming, livestock rearing and fish farming.

---

6) Conclusions on impact of discharge and predicted effects of nutrient removal (see guidance note 33).

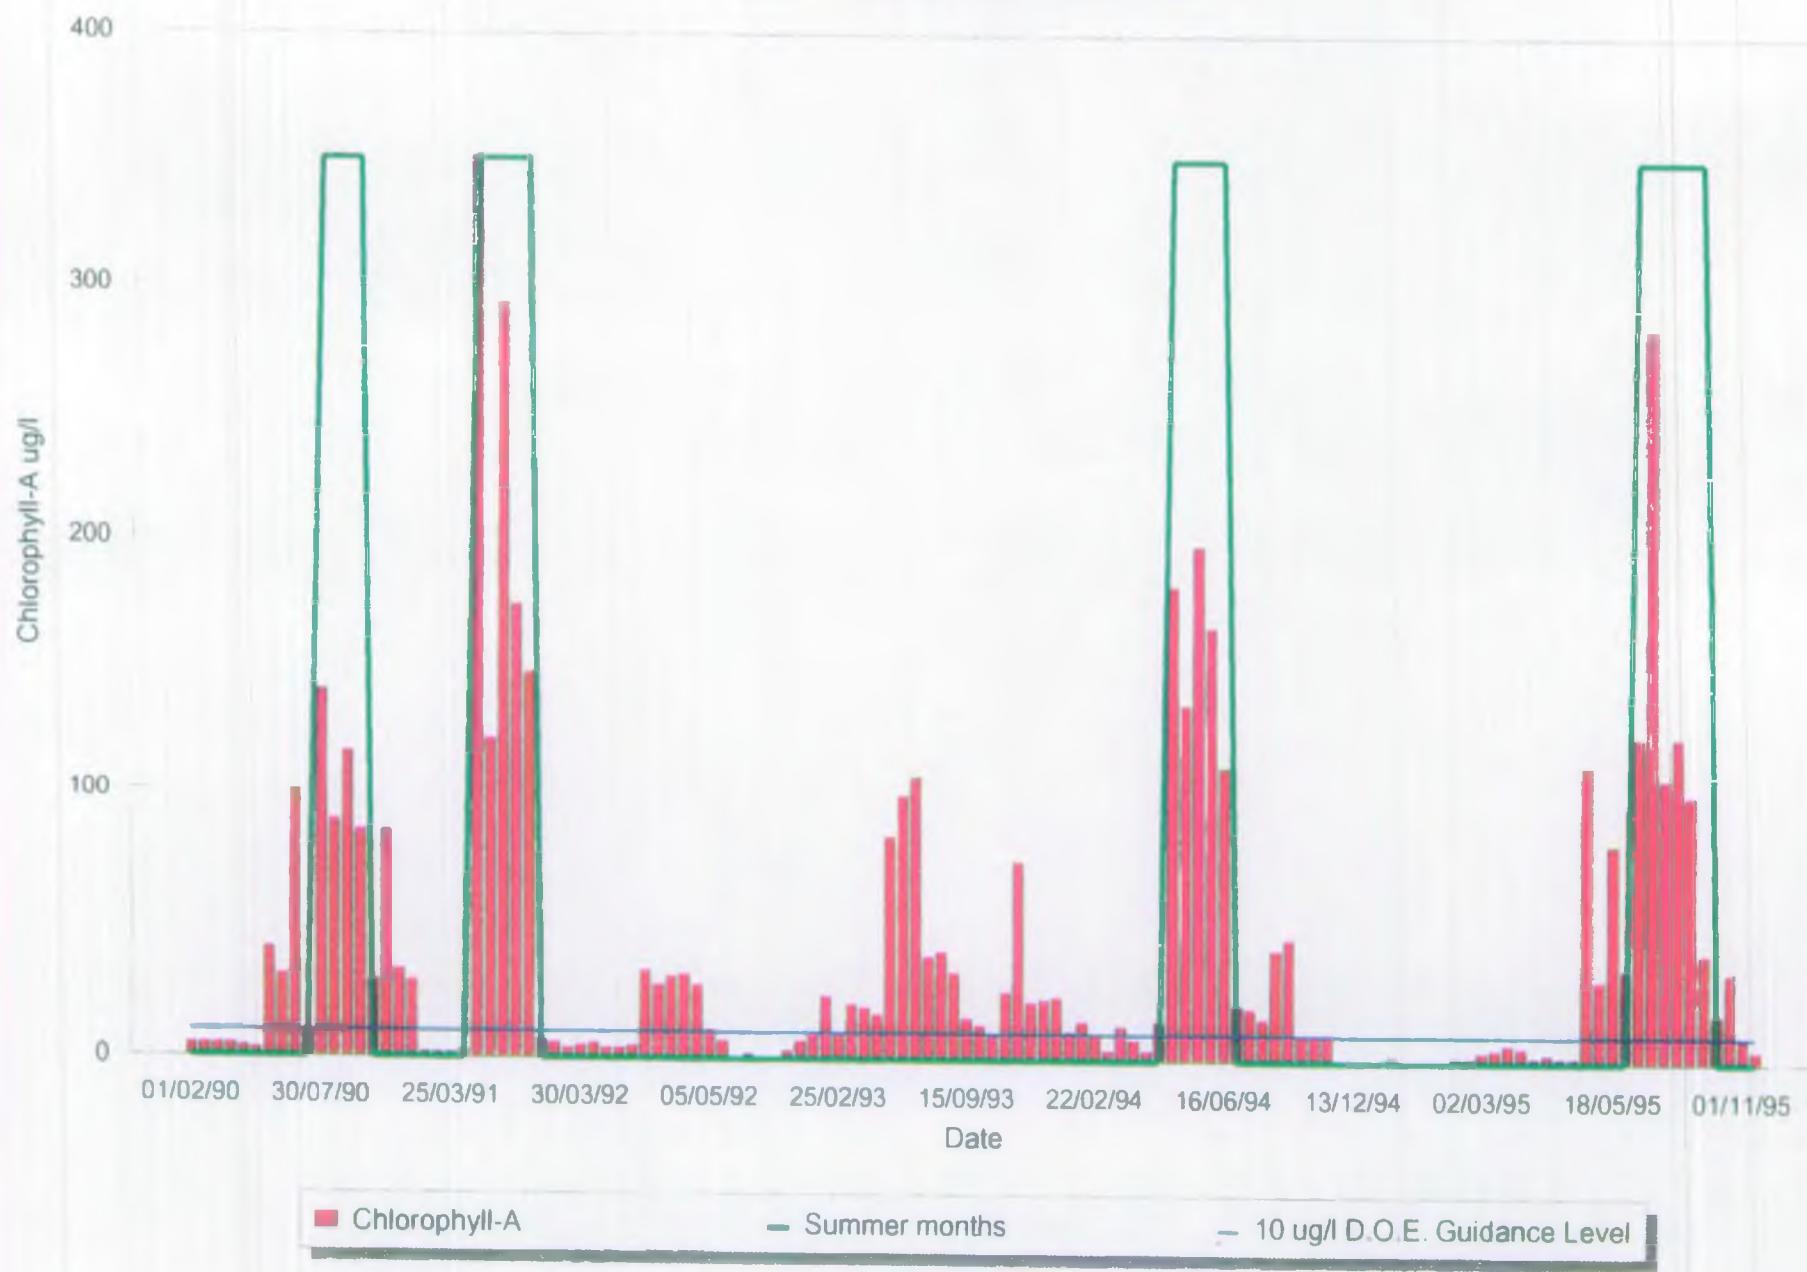

The modelling carried out shows that when the discharge from Ashford STW is suppressed there is a reduction in the mean nitrogen levels within the estuary at locations upstream and downstream. If nutrients are removed from the discharge, it is probable that the eutrophic conditions will be reduced. In view of the planned changes to the sewage discharge regime (see 4, 5 above) the reduced load of nutrients into the Taw estuary could reduce eutrophication. The proposed removal of the discharge into the lower Torridge estuary could have a similar beneficial effect. Taking these factors into account along with the effects of freshwater inputs, it is difficult to gauge the benefits of nutrient removal for Ashford STW. My conclusion is that there is no clear case either way. The estuary should be given a protective status with the view to examining the effects of the proposals for Velator, Yelland and Bideford after a period of eighteen months.

## Notes:

1: All counts given as number of cells per ml unless taxon name marked (\*) where the count applies to numbers of colonies per ml.

2: Values in bold indicate samples where chlorophyll A measurement threshold has been exceeded.

3: Where the DoE cell count criterion has been exceeded by a total count they have been identified thus: Y.

## Taw Estuary Classification Results - 1995 Survey

### Biological Survey Description

The nine estuarine Sensitive Areas/Polluted Waters were flown-over at low water and "photographed" using Compact Aerial Spectrographic Imagery (CASI). This system digitally records the reflected wavelength information from vegetation and physical features and divides the intertidal area into classes based on this spectral information. As this spectral data is digital information, the calculation of the surface area of each class and hence the percentage cover of the seaweeds *Ulva* and *Enteromorpha* is easily generated.

**Quality Assurance:** The CASI system has been extensively tested in Langstone Harbour ("Langstone Harbour Inter-tidal Vegetation Classification Survey" by R. C. Allen and R. C. Saull, 1996. A report by the National Rivers Authority National Centre for Instrumentation & Marine Surveillance). Ground-truthing field surveys were undertaken by marine biologists to visually identify features, and photographic and video evidence was collected to test the accuracy of the images generated.

### Taw Classification Results Table 1995

Percentage cover of the algae *Enteromorpha* and *Ulva*.

Intertidal area: 6160600 m<sup>2</sup>

Land Cover Classes	Square Metres	Percentage	Calculated Algae
Wet Mud	909500	14.76	
Dry Mud/Sand	4427375	71.87	
Wet Mud Channels	439275	7.13	
Algae (50% cover)	249450	4.05	2.025
Unclassified	135000	2.19	
<b>Totals</b>	<b>6160600 m<sup>2</sup></b>	<b>100 %</b>	<b>2.025 %</b>

### Taw Estuary Ground-Truthing Site Locations

<u>Site</u>	<u>NGR</u>
1) Behind Crow Point	SS 4655 3225
2) Broad Sands	SS 4670 3260
3) Opposite White House	SS 4700 3300
4) Mouth of River Caen	SS 4830 3360
5) SS Chivenor	SS 4900 3390
6) Yelland Nature Reserve	SS 4900 3325
7) Penthill Point	SS 5230 3415

The Aerial Survey was carried out on 15 August 1995, and the Biological Survey on 30 August 1995.

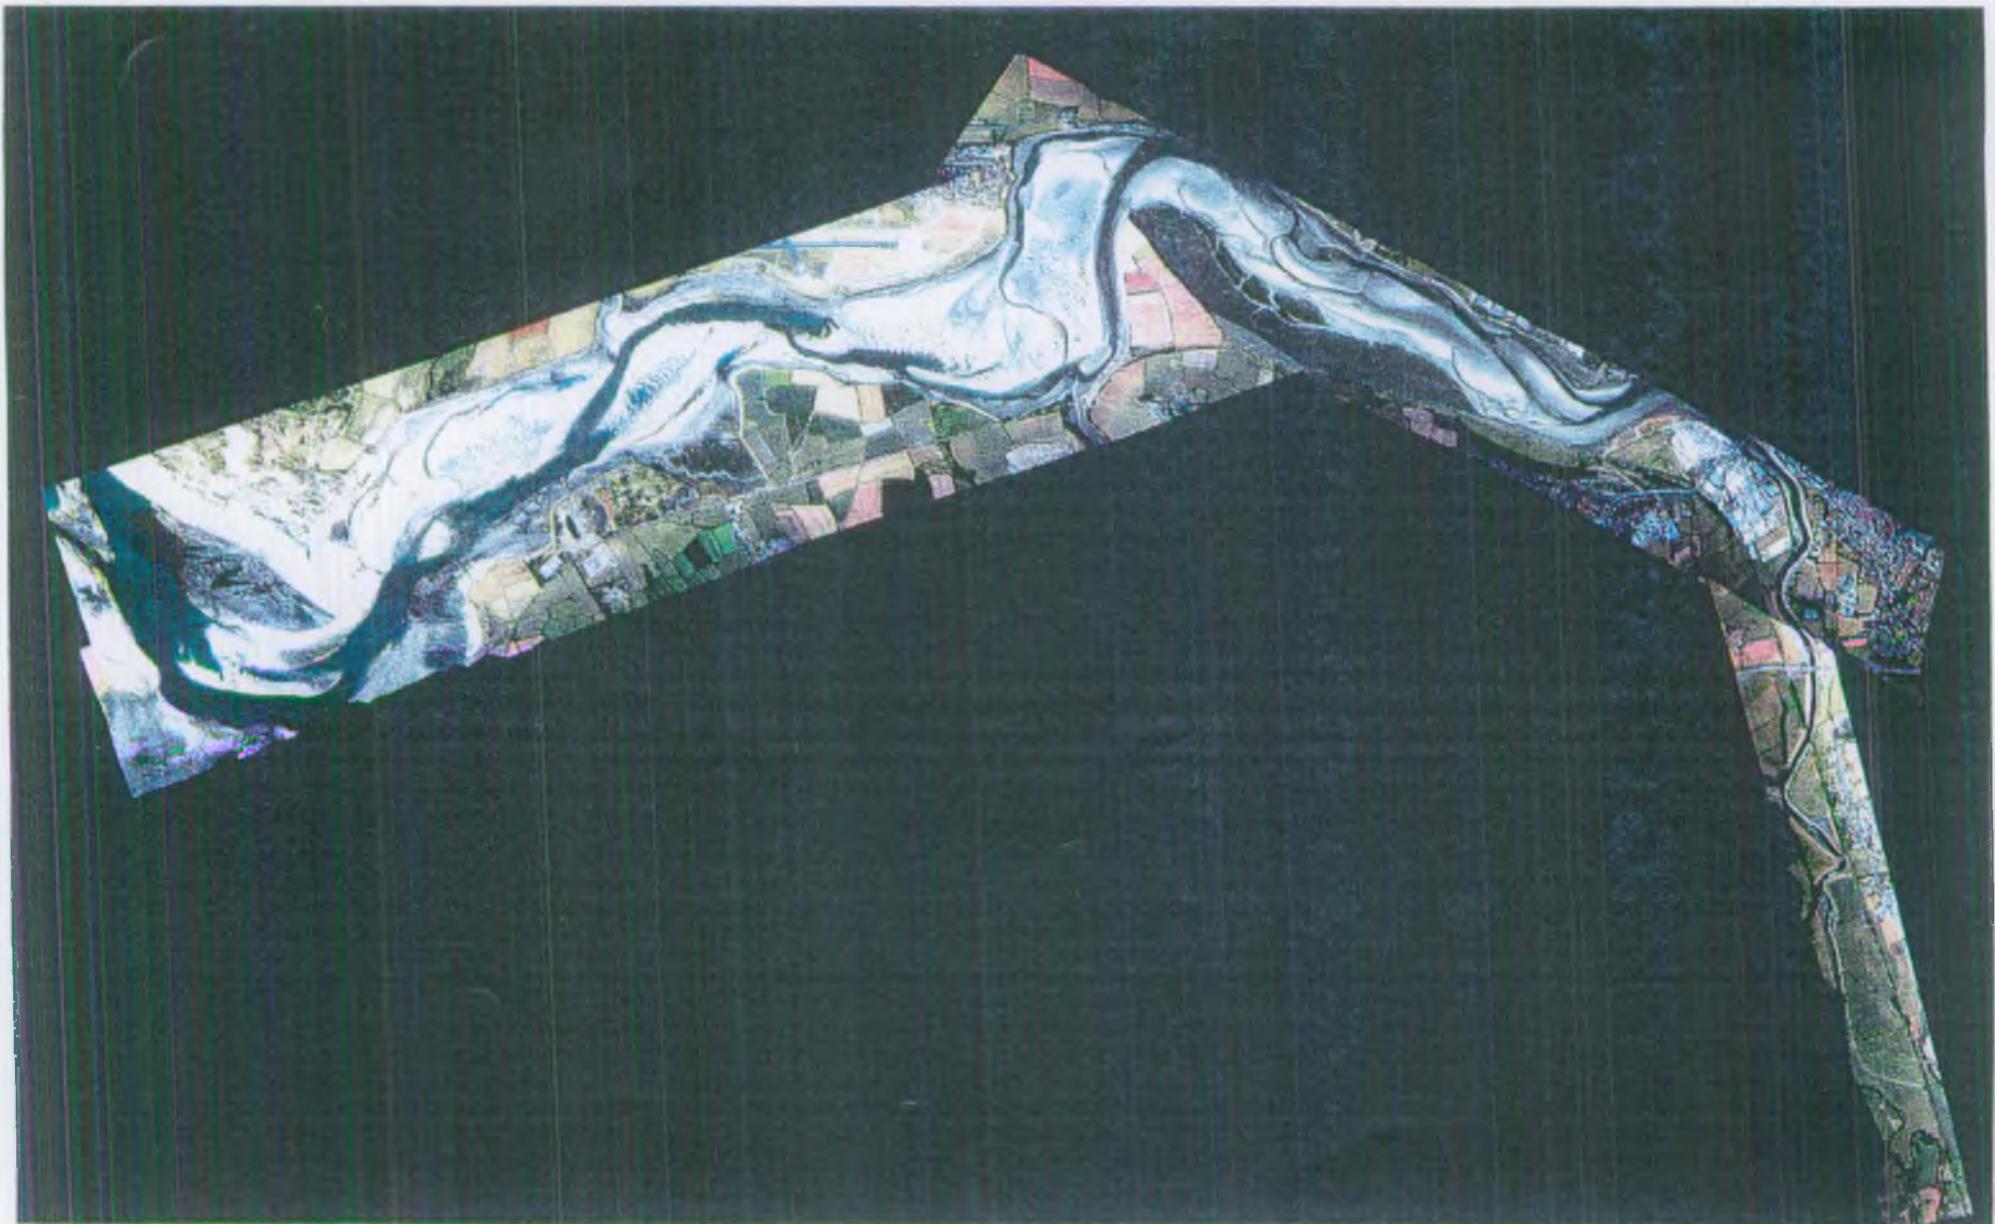

I have no information on the duration of the algae in the estuary.

Taw estuary sampling method for NWC Classification August 1992

Each intertidal site consisted of five replicate 0.01m<sup>2</sup> cores, each to a depth of 150 mm. Collected material was sieved on site by puddling in adjacent water on a 0.5 mm mesh sieve. Samples were then fixed in 10% buffered formalin for subsequent sorting, identification and enumeration.

Shore height for each site was estimated and was maintained for each replicate. Sediment type was also noted along with the RPD layer depth (where the sediment becomes anoxic):

Site	1: Mid Tide Level-Low Water Neaps (MTL-LWN)	Sand/clay	Rpd:	>150 mm
	2: MTL-LWN	Sand/clay		?
	3: MTL	Sand		0 mm
	4: LWN	Mud/sand		10 mm
	5: LWN	Sand		40 mm
	6: LWN	Mud/sand		<10mm
	12: Low Water Springs (LWS)	Sand		>150 mm
	13: LWS	Sand		100 mm
	14: LWS	Sand/pebbles		>150 mm

Subtidal samples consisted of five replicate 0.05m<sup>2</sup> Van Veen Grab with a bite depth of at least 5 cm. Collected material was treated in the same manner as described for intertidal samples. Depth below chart datum) and sediment type were noted:

Site	A: 1 m	Fine clean sand
	B: 4 m	Clean sand
	D: 4.5 m	Sand
	E: 7 m	Clean sand

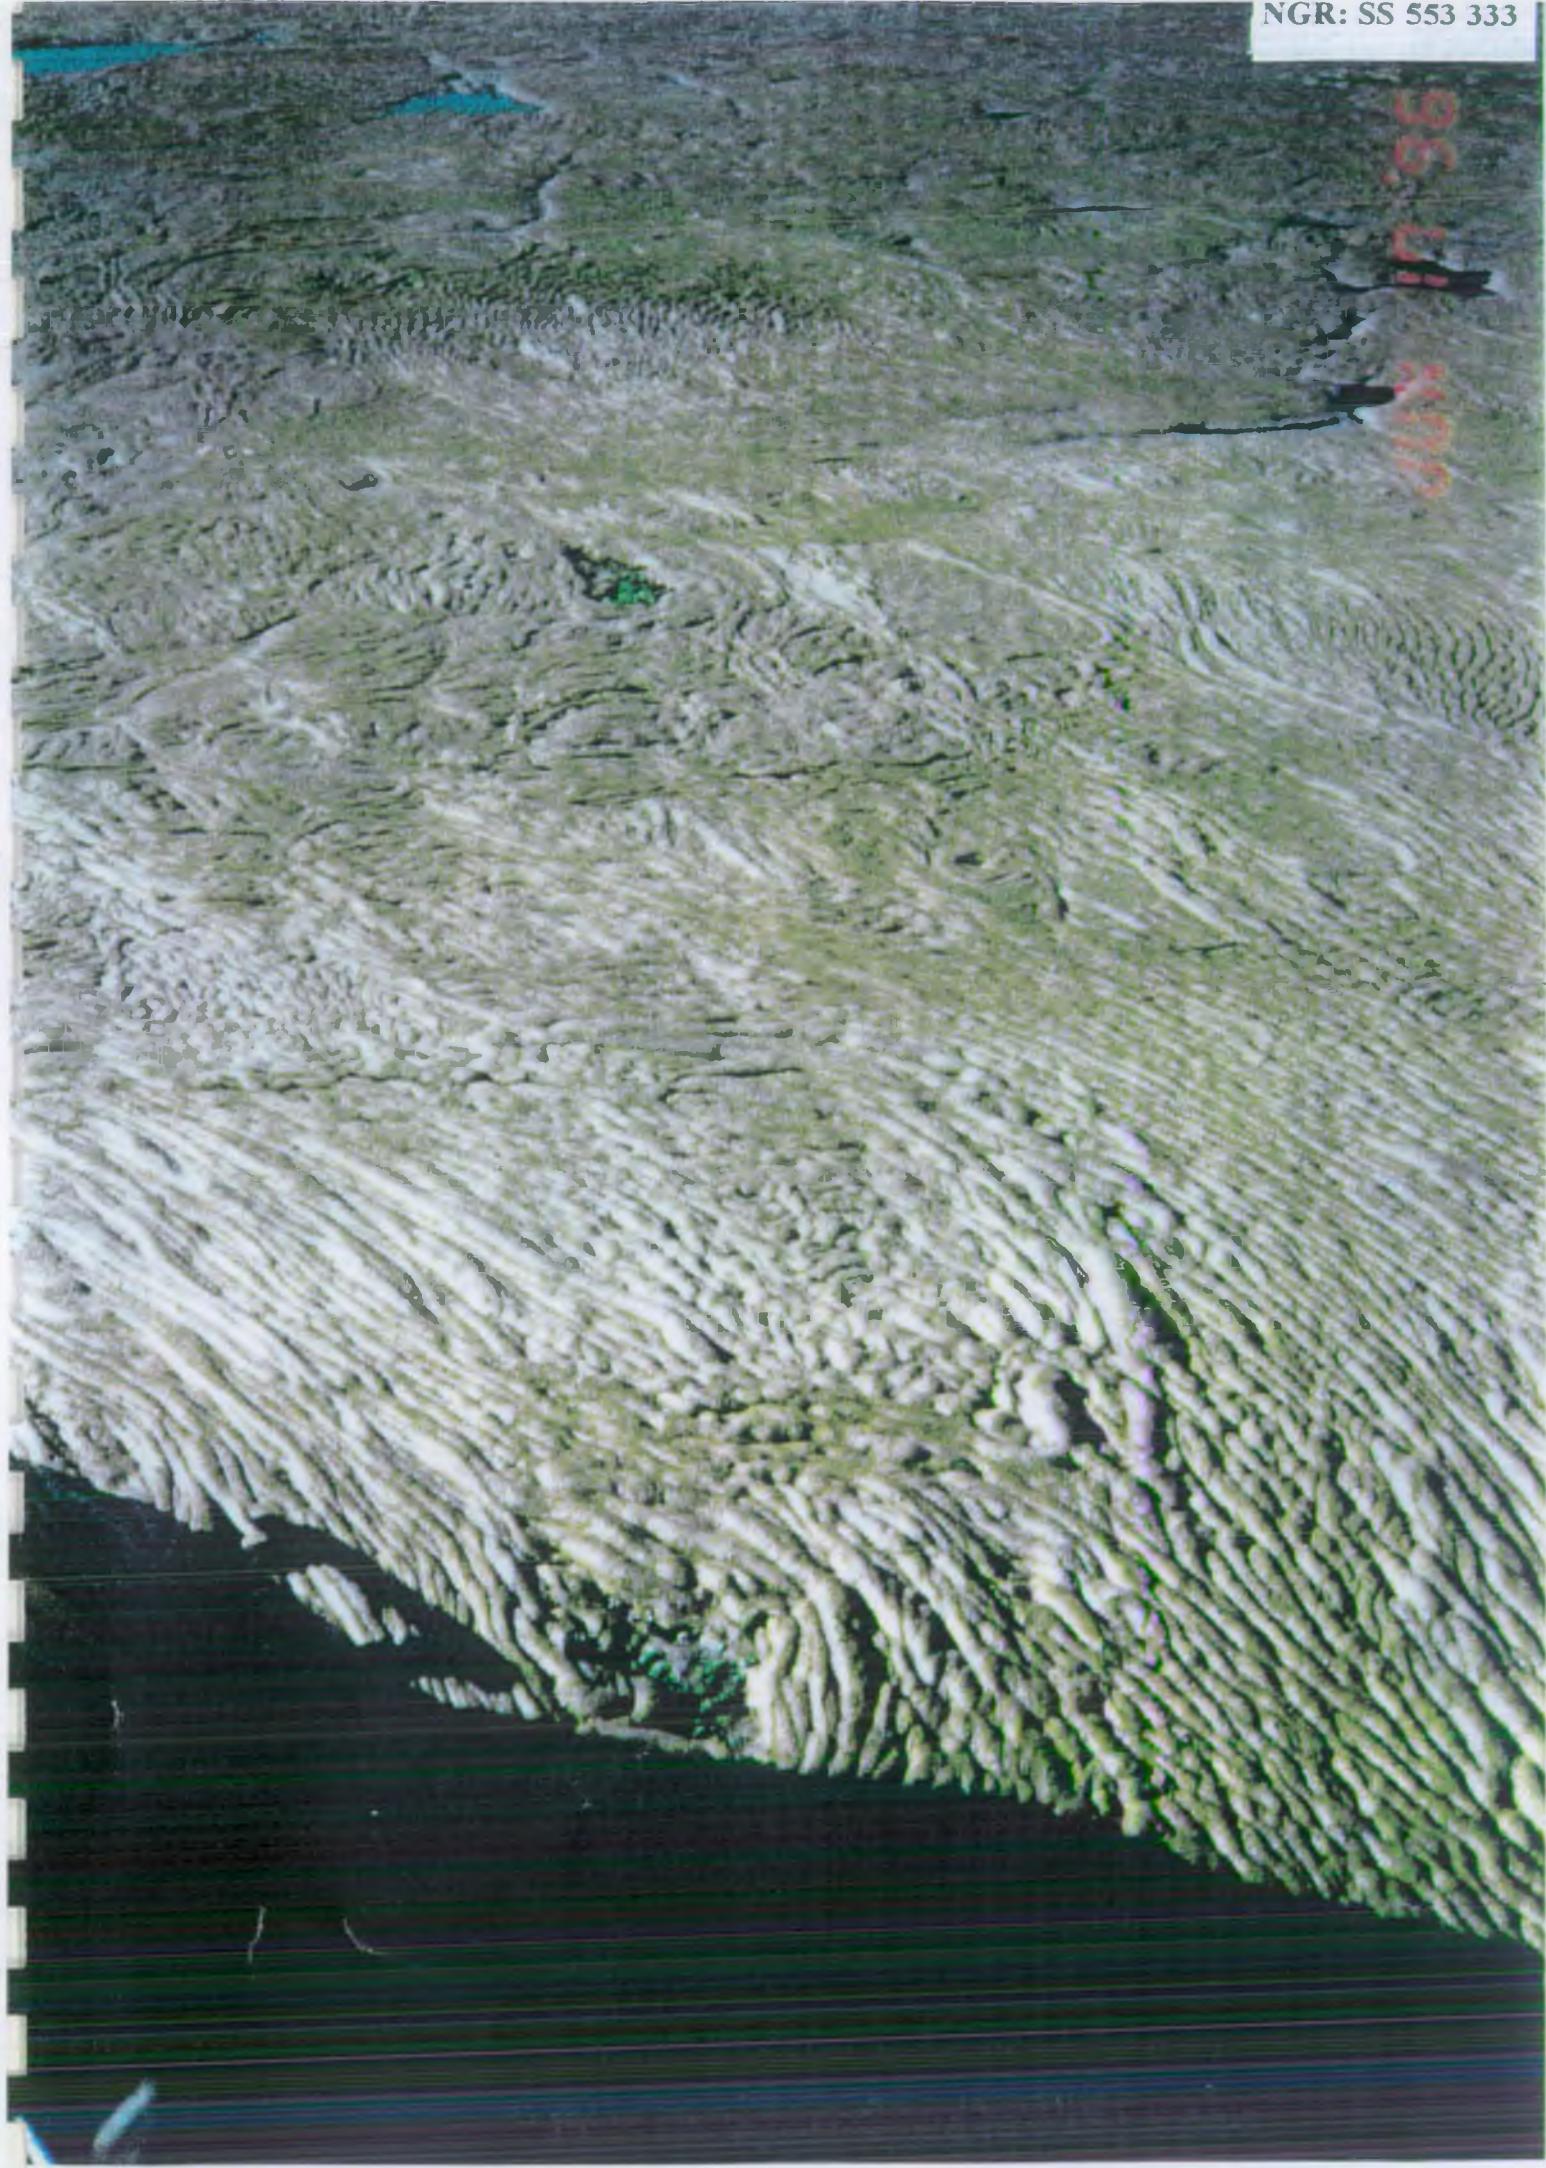

Macrofauna survey 1992 for estuary classification. Subtidal and intertidal sand areas sparsely inhabited by few taxa, dominated by amphipoda. Mud flats with typical fauna. Sand dwelling fauna may be susceptible to eutrophic related impact, particularly if macroalgal growth increases dramatically. Its sparseness may primarily be due to prevailing hydrography. Increased nutrient input likely to trigger faunal changes which do not appear to have manifested as yet (at least by 1992).

South West Region

INCIDENT REPORT

1043 11-Feb-97

Incident Number.... 17510 Priority.... Immediate (2 Hours)

Problem..... POLLUTION RISK - WATER QUALITY (PQ)

Reported by..... MIKE BISHOP (by Telephone) Phone 0831 825864

Reporters Address.. EA

Incident Location.. BY PILL FARM ON RIVER TAW

Place (Gazetteer).. BARNSTAPLE 30A SS558332

Water Stretch ID... 50/30A/000/01S Area..... Devon

Catchment..... TAW ESTUARY

Watercourse..... TAW ESTUARY - SOUTH BANK

Stretch..... LONGBRIDGE - INSTOW

Fish Dead..... 0 Fish Distressed.... 0

Pollution Confirmed None (0)

Pollution Source... MISC PREMISES UNKNOWN (MU)

Pollutant..... MISCELLANEOUS ALGAE (MA)

### AILS

REPORTER PHONE IN TO SAY RIVER IS 'AWFUL GREEN' BY PILL FARM ON RIVER TAW.

PARENTLY THIS IS ON THE BARNSTAPLE SIDE OF THE NEW BRIDGE OVER THE TAW.

EXCESSIVE ALGAE GROWTH DUE TO LOW FLOWS AND Elevated NUTRIENT STATUS IN

ESTUARY. MONITORS IN PLACE DURING SUMMER '96 TO HELP CASE FOR CLASSIFYING

ESTUARY AS "SENSITIVE WATERS".

Occurred at 1555 on 19-AUG-96

Received at 1555 on 19-AUG-96 by Area Environmental (Devon)

MONDED at 1610 on 19-AUG-96 by Area Environmental (Devon)(SEAMANJ)

Set Date 1755 on 19-AUG-96

Completed at 1620 on 30-AUG-96

### LES

Samples are recorded as being specifically relevant to this incident.
